SHARP INTEGRAL INEQUALITIES FOR HARMONIC FUNCTIONS

FENGBO HANG, XIAODONG WANG, AND XIAODONG YAN

ABSTRACT. Motivated by Carleman’s proof of isoperimetric inequality in the plane, we study some sharp integral inequalities for harmonic functions on the upper halfspace. We also derive the regularity for nonnegative solutions of the associated integral system and some Liouville type theorems.

1. Introduction

The classical isoperimetric inequality in the plane states that for any bounded domain with area $A$ and boundary length $L$ we have

\[ 4\pi A \leq L^2 \]

and equality holds if and only if the domain is a disk. Inequality (1.1) remains true for bounded domains in a simply connected surface with nonpositive curvature. Among the proofs of this fact the one due to Carleman [C] is particularly interesting. Indeed, let $(M^2, g)$ be any simply connected compact surface with boundary and nonpositive curvature, it follows from Riemann mapping theorem that $(M^2, g)$ is isometric to $(\overline{B}_1^2, e^{2w}g_{\mathbb{R}^2})$, here $B_1^2$ is the two dimensional open unit disk and $g_{\mathbb{R}^2}$ is the Euclidean metric on $\mathbb{R}^2$. The nonpositivity of curvature implies that $w$ is a subharmonic function. Let $u$ be the harmonic function on $B_1$ with the same boundary value as $w$, then $w \leq u$. In [C] it was proved that for any smooth harmonic function on $\overline{B}_1^2$ we have

\[ \int_{B_1} e^{2u} \, dx \leq \frac{1}{4\pi} \left( \int_{S^1} e^u \, d\theta \right)^2 \]

and equality holds if and only if $u(x) = c$ or $-\log |x - x_0| + c$ for some $x_0 \in \mathbb{R}^2 \setminus \overline{B}_1$ and constant $c$. We may ask for natural generalizations to higher dimensions. Without an analog of the Riemann mapping theorem, we may start with a metric $g = \rho^{\frac{4}{n-2}} g_{\mathbb{R}^n}$ on $\overline{B}_1^n$ with nonpositive scalar curvature, here $n \geq 3$, $B_1^n$ is the open unit ball in $\mathbb{R}^n$ and $g_{\mathbb{R}^n}$ is the Euclidean metric on $\mathbb{R}^n$. It follows that $\rho$ is a subharmonic function. Under the metric $g$ the volume of $\overline{B}_1$ is equal to $\int_{B_1} \rho^{\frac{2(n-1)}{n-2}} \, dx$ and the area of $\partial B_1$ is equal to $\int_{\partial B_1} \rho^{\frac{2(n-1)}{n-2}} \, dS$. We would like to know whether the inequality

\[ \int_{B_1} \rho^{\frac{2n}{n-2}} \, dx \leq n^{-\frac{n}{n-2}} \omega_n^{-\frac{1}{n-1}} \left( \int_{\partial B_1} \rho^{\frac{2(n-1)}{n-2}} \, dS \right)^{\frac{n}{n-1}} \]

is still true. Here $\omega_n$ is the Euclidean volume of the unit ball in $\mathbb{R}^n$. Since $\rho$ is bounded from above by the harmonic function with the same boundary value, we
only need to know whether the inequality
\begin{equation}
|u|_{L^{2n/(n-2)}(B_1)} \leq n^{-\frac{n-2}{2(n-1)} \omega_n} n^{-\frac{n-2}{2(n-1)}} |u|_{L^{2(n-1)/(n-2)}(\partial B_1)}
\end{equation}
is true for every smooth harmonic function \( u \) on \( \overline{B_1} \). The answer to this question is affirmative and the inequality may be proved by subcritical approximation (see [HWY]). However, for future purpose it seems helpful to transfer this problem to upper halfspace and derive some Liouville type results. Indeed, assume \( u \) is a positive harmonic function on \( \overline{B_1} \), let \( e_n = (0, \cdots, 0, 1) \) and \( \phi \) be the Möbius transformation given by
\begin{equation}
\phi(x) = \frac{x + e_n}{|x + e_n|^2} - e_n.
\end{equation}
Then \( \phi(\mathbb{R}^n_+) = B_1 \) and
\begin{equation}
\phi^* g_{\mathbb{R}^n_+} = \frac{1}{|x + e_n|^2} \sum_{i=1}^n dx_i \otimes dx_i.
\end{equation}
Here \( \mathbb{R}^n_+ = \{ x \in \mathbb{R}^n : x_n > 0 \} \). Let
\begin{equation}
v(x) = \frac{1}{|x + e_n|^{n-2}} u \left( \frac{x + e_n}{|x + e_n|^2} - e_n \right),
\end{equation}
then \( \phi^* (u^{\frac{n-4}{2}} g_{\mathbb{R}^n_+}) = v^{\frac{n-4}{2}} g_{\mathbb{R}^n_+} \). The inequality (1.3) becomes
\begin{equation}
|v|_{L^{2n/(n-2)}(\mathbb{R}^n_+)} \leq n^{-\frac{n-2}{2(n-1)} \omega_n} n^{-\frac{n-2}{2(n-1)}} |v|_{L^{2(n-1)/(n-2)}(\mathbb{R}^{n-1})}.
\end{equation}
Note that since \( v \) is the Poisson integral of \( v|_{\mathbb{R}^{n-1}_-} \), inequality (1.4) follows from Theorem 1.1 below. To state the results, let us fix some notations. For convenience, we use \( x, y, \cdots \) for points in \( \mathbb{R}^n \) and \( \xi, \zeta, \cdots \) for points in \( \mathbb{R}^{n-1} = \{ x \in \mathbb{R}^n : x_n = 0 \} \). For \( x \in \mathbb{R}^n \), we let \( x' = (x_1, \cdots, x_n-1) \), \( x = (x', x_n) \). The Poisson kernel for the upper half space is given by (see [S, p61])
\begin{equation}
P(x, \xi) = \frac{2}{n \omega_n} \frac{x_n}{(|x' - \xi|^2 + x_n^2)^{n/2}} \quad \text{for } x \in \mathbb{R}^n_+, \xi \in \mathbb{R}^{n-1}.
\end{equation}
Given a function \( f \) defined on \( \mathbb{R}^{n-1} \), let
\begin{equation}
(P f)(x) = \int_{\mathbb{R}^{n-1}_-} P(x, \xi) f(\xi) \, d\xi \quad \text{for } x \in \mathbb{R}^n_+.
\end{equation}
We have the following sharp inequality for \( P \) (see Theorem 4.1):

**Theorem 1.1.** Assume \( n \geq 3 \), then for any \( f \in L^{2(n-1)/(n-2)}(\mathbb{R}^{n-1}) \),
\begin{equation}
| Pf |_{L^{2n/(n-2)}(\mathbb{R}^n_+)} \leq n^{-\frac{n-2}{2(n-1)} \omega_n} n^{-\frac{n-2}{2(n-1)}} | f |_{L^{2(n-1)/(n-2)}(\mathbb{R}^{n-1})}.
\end{equation}
Moreover, equality holds if and only if \( f(\xi) = g(\xi - \xi_0)/(\lambda^2 + |\xi - \xi_0|^2)^{\frac{n-2}{2}} \) for some constant \( \lambda \) and \( \xi_0 \in \mathbb{R}^{n-1} \).
If we look at the variational problem
\begin{equation}
(1.6) \quad c_n = \sup \left\{ |P f|_{L^{\frac{2n}{n-2}}(\mathbb{R}^n)} : f \in L^{\frac{2(n-1)}{n-2}}(\mathbb{R}^n), |f|_{L^{\frac{2(n-1)}{n-2}}(\mathbb{R}^{n-1})} = 1 \right\}.
\end{equation}
Then any nonnegative critical function \( f \), after scaling must satisfy
\begin{equation}
(1.7) \quad f(\xi) = \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2}^{n-2} \int_{\mathbb{R}^n} P(x, \xi)(P f)(x) \frac{n+2}{n-2} dx.
\end{equation}
We have the following Liouville type theorem (see Proposition 6.1) which is in the same spirit as those in [GNN, CGS, CLO2, L].

**Theorem 1.2.** Assume \( n \geq 3 \), \( f \in L^{\frac{2(n-1)}{n-2}}(\mathbb{R}^{n-1}) \) is nonnegative, not identically zero and it satisfies (1.7), then for some \( \lambda > 0 \) and \( \xi_0 \in \mathbb{R}^{n-1} \),
\[
f(\xi) = c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{\frac{n-2}{n}}.
\]
We note that the condition \( f \in L^{\frac{2(n-1)}{n-2}}(\mathbb{R}^{n-1}) \) can not be dropped since \( c(n)|\xi|^{-\frac{n-2}{n}} \)
is a singular solution for (1.7). During the process of identifying maximizing functions in Theorem 1.1 and the critical functions in Theorem 1.2, we establish the following interesting fact (see Proposition 4.1):

**Proposition 1.1.** Let \( n \geq 2 \), \( u \) be a function on \( \mathbb{R}^n \) which is radial with respect to the origin, \( 0 < u(x) < \infty \) for \( x \neq 0 \), \( e_1 = (1, 0, \cdots, 0) \), \( \alpha \in \mathbb{R}, \alpha \neq 0 \). If \( v(x) = |x|^\alpha u(\frac{x}{|x|} - e_1) \) is radial with respect to some point, then either \( u(x) = \left(c_1 |x|^2 + c_2\right)^{\alpha/2} \) for some \( c_1 \geq 0 \), \( c_2 > 0 \) or
\[
u(x) = \begin{cases} 
c_1 |x|^\alpha, & \text{if } x \neq 0, 
c_2, & \text{if } x = 0,
\end{cases}
\]
for some \( c_1 > 0 \) and \( c_2 \), an arbitrary number.

There are similar statements for the cases \( \alpha = 0 \) or \( n = 1 \) (see Remark 4.1 and Proposition 4.2). The crucial point of Proposition 1.1 is that we do not need any regularity assumption on the function \( u \). This is very convenient when the regularity of extremal functions are hard to get apriori. The radial symmetry property of function may come from symmetrization arguments or the method of moving planes etc. For example, Proposition 1.1 gives another way to determine the maximizing functions for those cases of Hardy-Littlewood-Sobolev inequalities studied in [Li2, section III]. The formulation of Proposition 1.1 is motivated from previous works in [CL, O], [CLO2, section 3] and [CLO3, section 6]. It is worth pointing out that Proposition 1.1 is the fact for method of moving planes which corresponds to the fact [LZ, lemma 2.5] or [L, lemma 5.8] for the method of moving spheres, a variant of the method of moving planes.

According to Proposition 2.1 below, for \( n \geq 2 \) and \( 1 < p < \infty \) the operator
\[
P : L^p(\mathbb{R}^{n-1}) \to L^{\frac{np}{n-2p}}(\mathbb{R}_+^n) : f \mapsto Pf
\]
is always a bounded linear map. From the analytical point view it is interesting to consider the variational problem

\begin{equation}
\tag{1.8}
c_{n,p} = \sup \left\{ \left| \mathcal{P} f \right|_{L^{n/p}(\mathbb{R}^n_+)} : f \in L^p(\mathbb{R}^{n-1}), \left| f \right|_{L^p(\mathbb{R}^{n-1})} = 1 \right\}
\end{equation}

for all such \( p \)'s. Fix \( 1 < p < \infty \), for a function \( f \) defined on \( \mathbb{R}^{n-1} \), \( \lambda > 0 \) and \( \zeta \in \mathbb{R}^{n-1} \), we write

\[ f^\lambda,\zeta \left( \xi \right) = \lambda^{-\frac{n-1}{p}} f \left( \frac{\xi - \zeta}{\lambda} \right) \text{ for } \xi \in \mathbb{R}^{n-1}. \]

Then we have (see Theorem 3.1 and Theorem 4.1):

**Theorem 1.3.** Given \( n \geq 2 \) and \( 1 < p < \infty \).

- Let \( f_i \) be a maximizing sequence of functions for (1.8), then after passing to a subsequence there exists \( \lambda_i > 0 \) and \( \zeta_i \in \mathbb{R}^{n-1} \) such that \( f_i^{\lambda_i,\zeta_i} \to f \) in \( L^p(\mathbb{R}^{n-1}) \). In particular, there exists at least one maximizing function.
- After multiplying by a nonzero constant, every maximizer \( f \) of (1.8) is nonnegative, radial symmetric with respect to some point, strictly decreasing in the radial direction and it satisfies

\begin{equation}
\tag{1.9}
f \left( \xi \right)^{p-1} = \int_{\mathbb{R}^n_+} P \left( x, \xi \right) (\mathcal{P} f)(x) \frac{dx}{\omega_n} \end{equation}

- If \( n \geq 3 \) and \( p = \frac{2(n-1)}{n-2} \), then any maximizer of (1.8) must be of the form

\[ f \left( \xi \right) = \pm c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{\frac{n-2}{2}} \text{ for some } \lambda > 0, \xi_0 \in \mathbb{R}^{n-1}. \]

In particular \( c_n \frac{2(n-1)}{n-2} = n \frac{n-2}{2(n-1)} \omega_n \frac{n-2}{\pi^{n/2}} \).

- If \( n \geq 3 \) and \( p = \frac{2(n-1)}{n} \), then any maximizer of (1.8) must be of the form

\[ f \left( \xi \right) = \pm c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{n/2} \text{ for some } \lambda > 0, \xi_0 \in \mathbb{R}^{n-1}. \]

In particular

\[ c_n \frac{2(n-1)}{n} = \frac{1}{\sqrt{2(n-2)}} \frac{(n-2)!}{\Gamma \left( \frac{n-1}{2} \right)} \frac{1}{\pi^{n/2}}. \]

It is interesting that the problem considered here demonstrates very similar structures to the sharp Hardy-Littlewood-Sobolev inequalities studied in [Li2]. Besides above properties of maximizing functions, we know they are smooth. This is a non-trivial fact since it does not follow from the usual bootstrap method. Indeed, we know all the nonnegative critical functions of (1.8) are smooth and radial symmetric with respect to some point (see Theorem 5.1 and Theorem 6.1). More precisely we have

**Theorem 1.4.** Given \( n \geq 2 \) and \( 1 < p < \infty \). If \( f \in L^p(\mathbb{R}^{n-1}) \) is nonnegative, not identically zero and it satisfies (1.9), then \( f \in C^\infty(\mathbb{R}^{n-1}) \), moreover it is radial symmetric with respect to some point and strictly decreasing along the radial direction.
In Section 2 below, we will collect some basic estimates for Poisson integrals and show the operator $P$ is bounded in suitable Lebesgue spaces and Lorentz spaces. In Section 3, we apply the general frame of concentration compactness principle ([Lion]) to show that every maximizing sequence of (1.8), after scaling and translation, must converge strongly. In Section 4, following Lieb we use the method of symmetrization based on the Riesz rearrangement inequalities ([LiL, section 3.7]) and its strong form ([Li1]) to show that all maximizing functions must be radial and give another approach to the existence of maximizing functions. In Section 5 we use the method in [Hn] to deduce the regularity of all nonnegative critical functions. Indeed what we will prove is a local regularity result. These results are similar in nature to those proved in [ChL, L]. In Section 6 we use the integral version of the method of moving planes ([GNN]), which was discovered in [CLO2], to deduce the symmetry property of the nonnegative critical functions. Here we will need some ideas from [Hn] again.

2. Basic inequalities for Poisson integrals

The main aim of this section is to record some basic estimates associated with Poisson kernel and harmonic extensions which we will use freely later. For $x_0 \in \mathbb{R}^n$ and $r > 0$, we write
\[ B^n_r(x_0) = \{ x \in \mathbb{R}^n : |x - x_0| < r \}, \quad B^n_r = B^n_r(0), \quad B^n_r = B^n_r \cap \mathbb{R}^n_+ \]
and $\overline{B^n_r}(x_0)$ to mean the closure of $B^n_r(x_0)$. Assume $n \geq 2$. For $t > 0$, $\xi \in \mathbb{R}^{n-1}$, we write
\[ P_t(\xi) = \frac{2}{n\omega_n} \frac{t}{(\xi^2 + t^2)^{n/2}}. \]

Clearly we have
- $P(\xi, \xi) = P_{x_0}(x' - \xi)$ for $x \in \mathbb{R}^n$, $\xi \in \mathbb{R}^{n-1}$.
- $(Pf)(x) = (P_{x_0} \ast f)(x')$ for $x \in \mathbb{R}^n$.
- $|P_t|_{L^1(\mathbb{R}^{n-1})} = 1$, $|P_t|_{L^\infty(\mathbb{R}^{n-1})} = \frac{2}{n\omega_n} t^{1-n}$.
- $|P_t|_{L^p(\mathbb{R}^{n-1})} = c(n, p) t^{\frac{n-1}{p} - \frac{n-1}{p-1}}$ for $\frac{n-1}{p} < p \leq \infty$.

Recall if $X$ is a measure space, $p > 0$ and $u$ is a measurable function on $X$, then
\[ |u|_{L^p_w(X)} = \sup_{t>0} t |u| > t^{1/p}. \]
The space $L^p_w(X) = \{ u \, : \, u \text{ is measurable and } |u|_{L^p_w(X)} < \infty \}$. More generally, for any $0 < p < \infty$ and $0 < q \leq \infty$, we have the Lorentz norm $|f|_{L^{p,q}(X)}$ and Lorentz space $L^{p,q}(X)$ (see [SW, p188]). $L^p_w(X) = L^{p,\infty}(X)$ is a special case of such spaces.

Proposition 2.1. We have
\[ |Pf|_{L^p_w(\mathbb{R}^n_+)} \leq c(n) |f|_{L^1(\mathbb{R}^{n-1})}. \]
We only need to prove the weak type estimate. The strong estimate follows.

Proof. We only need to prove the weak type estimate. The strong estimate follows from Marcinkiewicz interpolation theorem (see [SW, p197]) and the basic fact \( |Pf|_{L^\infty(\mathbb{R}_+^n)} \leq |f|_{L^\infty(\mathbb{R}_+^{n-1})} \). To prove the weak type estimate, we may assume \( f \geq 0 \) and \( |f|_{L^1(\mathbb{R}_+^{n-1})} = 1 \). First we observe that \( (Pf)(x) \leq \frac{c(n)}{x^n} \) for \( x \in \mathbb{R}_+^n \) and

\[
\int_{x \in \mathbb{R}_+^n, 0 < x_n < a} (Pf)(x) \, dx = \int_{\mathbb{R}_{n-1}} d\xi \left( \int_0^a dx_n \int_{\mathbb{R}_{n-1}} Pf(x, \xi) \, dx' \right) = a
\]

for \( a > 0 \). Hence for \( t > 0 \),

\[
|Pf| > t | = \left\{ x \in \mathbb{R}_+^n : 0 < x_n < c(n) t^{-\frac{n}{n-1}}, (Pf)(x) > t \right\}
\leq \frac{1}{t} \int_{0 < x_n < c(n) t^{-\frac{n}{n-1}}, x_n' \in \mathbb{R}_{n-1}} (Pf)(x) \, dx = c(n) t^{-\frac{n}{n-1}}.
\]

The weak type inequality follows. \( \Box \)

Later we will also need some elementary estimates for the harmonic extensions. They are listed below.

- For \( 1 \leq p \leq q \leq \infty \), we have
  \[
  |P_t * f|_{L^q(\mathbb{R}_+^{n-1})} \leq c(n, p, q) t^{-(n-1)\left(\frac{1}{p} - \frac{1}{q}\right)} |f|_{L^p(\mathbb{R}_+^{n-1})}.
  \]
- Assume \( f(\xi) = 0 \) for \( |\xi| \geq R \), then we have
  \[
  |(P_t * f)(\xi)| \leq c(n, t) \left[ \left( \frac{|\xi|}{R} \right)^2 + t^2 \right]^{n/2} |f|_{L^1(\mathbb{R}_+^{n-1})}.
  \]
- Assume \( f(\xi) = 0 \) for \( |\xi| < R, 1 \leq p \leq \infty \), then we have
  \[
  |P_t * f|_{L^\infty(B_{R/h}^{n-1})} \leq c(n, p) t R^{-\frac{n-1}{p}} |f|_{L^p(\mathbb{R}_+^{n-1})}
  \]
  and
  \[
  |Pf|_{L^\infty(B_{R/h}^+(\mathbb{R}_+^{n-1}))} \leq c(n, p) R^{-\frac{n-1}{p}} |f|_{L^p(\mathbb{R}_+^{n-1})}.
  \]

For \( t > 0, \xi \in \mathbb{R}_+^{n-1} \), let

\[
Q_t(\xi) = P_t(\xi) \cdot \frac{\xi}{t} = \frac{2}{n \omega_n} \frac{|\xi|}{(|\xi|^2 + t^2)^{n/2}},
\]

then

- \( |Q_t|_{L^p(\mathbb{R}_+^{n-1})} = c(n, p) t^{-\frac{(n-1)(p-1)}{p}} \) for \( 1 < p \leq \infty \).
Let $\varphi \in L^\infty (\mathbb{R}^{n-1}) \cap \text{Lip} (\mathbb{R}^{n-1})$, then

$$|P_t * (\varphi f) - \varphi (P_t * f)| \leq [\varphi]_{\text{Lip}(\mathbb{R}^{n-1})} t Q_t * f.$$ 

In particular, it follows from Hausdorff-Young’s inequality that

$$|P_t * (\varphi f) - \varphi (P_t * f)|_{L^p(\mathbb{R}^{n-1})} \leq c (n, p, q) \epsilon^{1-(n-1)\left(\frac{1}{p} - \frac{1}{q}\right)} \|f\|_{L^p(\mathbb{R}^{n-1})}$$

for $1 \leq p < q \leq \infty$.

As a simple application of these estimates, we derive the following compactness result.

**Corollary 2.1.** For $1 \leq p < q < \infty$, the operator

$$P : L^p (\mathbb{R}^{n-1}) \to L^q_{\text{loc}} (\mathbb{R}^n_+)$$

is compact.

**Proof.** Assume $f_i \in L^p (\mathbb{R}^{n-1})$ such that $|f_i|_{L^p(\mathbb{R}^{n-1})} \leq 1$, it follows that

$$|(P f_i) (x)| \leq c (n, p) x_n^{-\frac{n-1}{p}}$$

for $x \in \mathbb{R}^n_+$.

By the gradient estimates of harmonic functions, after passing to a subsequence we have $P f_i \to u$ in $C^\infty_0 (\mathbb{R}^n_+)$. For any $R > 0$,

$$|P f_i - P f_j|_{L^q(B^+_R)}^q = \int_{x \in B^+_R, x_n \geq \epsilon} |P f_i - P f_j|^q dx + \int_{x \in B^+_R, x_n < \epsilon} |P f_i - P f_j|^q dx \leq \int_{x \in B^+_R, x_n \geq \epsilon} |P f_i - P f_j|^q dx + c (n, p, q) \epsilon^{1-(n-1)\left(\frac{1}{p} - \frac{1}{q}\right)}.

Hence

$$\limsup_{i, j \to \infty} |P f_i - P f_j|_{L^q(B^+_R)}^q \leq c (n, p, q) \epsilon^{1-(n-1)\left(\frac{1}{p} - \frac{1}{q}\right)}.

Let $\epsilon \to 0^+$, we see $P f_i$ is a Cauchy sequence in $L^q_{\text{loc}} (\mathbb{R}^n_+)$. 

Finally we derive a dual statement to Proposition 2.1. Let $u$ be a function on $\mathbb{R}^n_+$, we write

$$(T u) (\xi) = \int_{\mathbb{R}^n_+} P (x, \xi) u(x) dx.

**Proposition 2.2.** For $1 \leq p < n$ we have

$$|T u|_{L^\infty (\mathbb{R}^{n-1})} \leq c (n, p) |u|_{L^p (\mathbb{R}^n_+)}$$

for any $u \in L^p (\mathbb{R}^n_+)$. 

Proposition 3.1. Responding to [Lion, lemma 2.1], one maximizing function for the variational problem (3.1).

Assume \( u \) be a function defined on \( \mathbb{R}^n \). We will apply this principle to prove the following result.

The aim of this section is to show the existence of maximizing functions for sharp inequalities by the concentration compactness principle.

Proof. We may prove the inequality by a duality argument. Indeed, for any non-negative functions \( u \) on \( \mathbb{R}^n \) and \( f \) on \( \mathbb{R}^{n-1} \) we have

\[
0 \leq \int_{\mathbb{R}^{n-1}} (Tu)(\xi) f(\xi) d\xi = \int_{\mathbb{R}^{n-1}} d\xi \int_{\mathbb{R}^n} P(x,\xi) u(x) f(\xi) \, dx
\]

\[
= \int_{\mathbb{R}^n} (Pf)(x) u(x) \, dx \leq |Pf|_{L_{\frac{n}{n-1}}(\mathbb{R}^n)} |u|_{L^n(\mathbb{R}^n)}
\]

\[
\leq c(n,p) |u|_{L^n(\mathbb{R}^n)} |f|_{L_{\frac{n}{n-1}}(\mathbb{R}^{n-1})}.
\]

Inequality (2.3) follows. We may also prove such an inequality directly. Indeed, since

\[
|P(\cdot,\xi)|_{L_{\frac{n}{n-1}}(\mathbb{R}^n)} = |P(\cdot,0)|_{L_{\frac{n}{n-1}}(\mathbb{R}^n)} = c(n) < \infty,
\]

we see \( T : L^{n,1}(\mathbb{R}_+^n) \rightarrow L^\infty(\mathbb{R}^{n-1}) \) is a bounded linear map. On the other hand, for \( u \in L^1(\mathbb{R}_+^n) \), we have

\[
\int_{\mathbb{R}^{n-1}} (Tu)(\xi) d\xi \leq \int_{\mathbb{R}^{n-1}} d\xi \int_{\mathbb{R}^n} P(x,\xi) |u(x)| \, dx = \int_{\mathbb{R}^n} |u(x)| \, dx.
\]

Hence \( T : L^1(\mathbb{R}_+^n) \rightarrow L^1(\mathbb{R}^{n-1}) \) is also bounded. The inequality (2.3) follows from the Marcinkiewicz interpolation theorem. \( \square \)

3. The existence of maximizing functions for sharp inequalities by the concentration compactness principle

Assume \( n \geq 2 \) and \( 1 < p < \infty \). Let \( c_{n,p} \) be the sharp constant in (2.1), then

\[
c_{n,p} > 0 \text{ and } c_{n,p} \sup \left\{ \int_{\mathbb{R}_+^n} |Pf|_{\frac{n}{n-1}}^{n/p} \, dx : f \in L^p(\mathbb{R}^{n-1}) , |f|_{L^p(\mathbb{R}^{n-1})} = 1 \right\}.
\]

The aim of this section is to show \( c_{n,p} \) is attained by some functions. Let \( f \) be a function defined on \( \mathbb{R}^{n-1} \). For \( \lambda > 0 \) and \( \zeta \in \mathbb{R}^{n-1} \) we write \( f^{\lambda,\zeta}(\xi) = \lambda^{-\frac{n-1}{p-1}} f\left( \frac{\xi - \zeta}{\lambda} \right) \) for \( \xi \in \mathbb{R}^{n-1} \), then

\[
|f^{\lambda,\zeta}|_{L^p(\mathbb{R}^{n-1})} = |f|_{L^p(\mathbb{R}^{n-1})}, \quad |P f^{\lambda,\zeta}|_{L\frac{n}{n-1}(\mathbb{R}_+^n)} = |P f|_{L\frac{n}{n-1}(\mathbb{R}_+^n)}.
\]

In particular the variational problem (3.1) has both translation and dilation invariance. The problem fits in the general frame of concentration compactness principle of [Lion]. We will apply this principle to prove the following result.

Theorem 3.1. Assume \( n \geq 2 \) and \( 1 < p < \infty \). Let \( f_i \) be a maximizing sequence of functions for (3.1), then after passing to a subsequence there exists \( \lambda_i > 0 \) and \( \zeta_i \in \mathbb{R}^{n-1} \) such that \( f_i^{\lambda_i,\zeta_i} \rightarrow f \) in \( L^p(\mathbb{R}^{n-1}) \). In particular, there exists at least one maximizing function for the variational problem (3.1).

A basic ingredient in the proof of Theorem 3.1 is the following proposition corresponding to [Lion, lemma 2.1].

Proposition 3.1. Assume \( n \geq 2 \), \( 1 < p < \infty \) and \( f_i \in L^p(\mathbb{R}^{n-1}) \) such that \( f_i \rightharpoonup f \) in \( L^p(\mathbb{R}^{n-1}) \). After passing to a subsequence, assume

\[
|f_i|^p \, d\xi \rightharpoonup \mu \text{ in } \mathcal{M}(\mathbb{R}^{n-1}), \quad |P f_i|_{\frac{n}{n-1}} \, dx \rightharpoonup \nu \text{ in } \mathcal{M}(\mathbb{R}_+^n).
\]
Here $\mathcal{M}(\mathbb{R}^{n-1})$ denotes the space of all Radon measures on $\mathbb{R}^{n-1}$. Then we have

\begin{itemize}
  \item $\nu|_{\mathbb{R}^n_+} = |Pf|^{\frac{np}{n-1}} \, dx$.
  \item Moreover for any Borel set $E \subset \mathbb{R}^{n-1}$,
    \[ \nu(E)^{\frac{n-1}{np}} \leq c_{n,p} \mu(E)^{\frac{1}{p}}. \]
  \item There exists a countable set of points $\zeta_j \in \mathbb{R}^{n-1}$ such that
    \[ \nu = |Pf|^{\frac{np}{n-1}} \, dx + \sum_j \nu_j \delta_{\zeta_j}, \]
    here $\mu_j \equiv \mu(\{\zeta_j\})$ and
    \[ \nu_j^{\frac{n-1}{np}} \leq c_{n,p} \mu_j^{\frac{1}{p}}. \]
  \item If $\nu(\mathbb{R}^{n-1})^{\frac{n-1}{np}} \geq c_{n,p} \mu(\mathbb{R}^{n-1})^{\frac{1}{p}}$, then $\nu$ is supported on a single point.
\end{itemize}

Proof. Without losing of generality, we may assume $|f_1|_{L^p(\mathbb{R}^{n-1})} \leq 1$. Since

\[ |(Pf_1)(x)| \leq c(n,p) x_n^{\frac{n-1}{np}} \quad \text{for } x \in \mathbb{R}^n_+, \]

it follows from the gradient estimate of harmonic functions that $Pf_1 \to Pf$ in $C^\infty_{\text{loc}}(\mathbb{R}^n_+)$. In particular,

\[ \nu|_{\mathbb{R}^n_+} = |Pf|^{\frac{np}{n-1}} \, dx. \]

Let $\varphi \in C^\infty_c(\mathbb{R}^{n-1})$ and $\eta \in C^\infty_c([0, \infty))$ such that $0 \leq \eta \leq 1$, we have

\[ |\varphi(x') \eta(x_n) (Pf_1)(x)|_{L^{\frac{np}{n-1}}(\mathbb{R}^n)} \]
\[ \leq |\eta(x_n) P(\varphi f_1)(x)|_{L^{\frac{np}{n-1}}(\mathbb{R}^n)} + |\eta(x_n) (\varphi(x') (Pf_1)(x) - P(\varphi f_1)(x))|_{L^{\frac{n-1}{np}}(\mathbb{R}^n)} \]
\[ \leq c_{n,p} |\varphi f_1|_{L^p(\mathbb{R}^{n-1})} + c(n,p) |\nabla \varphi|_{L^\infty(\mathbb{R}^{n-1})} \left( \int_0^\infty \eta(t) \frac{np}{n-1} t^{\frac{n-1}{np}-1} \, dt \right)^{\frac{n-1}{np}}. \]

Now fix an $\eta \in C^\infty([0, \infty))$ such that $0 \leq \eta \leq 1$, $\eta(0) = 1$ and $\eta(t) = 0$ for $t \geq 1$. For $\varepsilon > 0$, denote $\eta_\varepsilon(t) = \eta(t/\varepsilon)$. Then

\[ |\varphi(x') \eta_\varepsilon(x_n) (Pf_1)(x)|_{L^{\frac{np}{n-1}}(\mathbb{R}^n_+)} \]
\[ \leq c_{n,p} |\varphi f_1|_{L^p(\mathbb{R}^{n-1})} + c(n,p) |\nabla \varphi|_{L^\infty(\mathbb{R}^{n-1})} \varepsilon. \]

Letting $i \to \infty$ and then $\varepsilon \to 0^+$, we see

\[ \left( \int_{\mathbb{R}^{n-1}} |\varphi|^{\frac{np}{n-1}} \, d\nu \right)^{\frac{n-1}{np}} \leq c_{n,p} \left( \int_{\mathbb{R}^{n-1}} |\varphi|^p \, d\mu \right)^{\frac{1}{p}}. \]

A limit process shows for any Borel function $h$ on $\mathbb{R}^{n-1}$,

\[ \left( \int_{\mathbb{R}^{n-1}} |h|^{\frac{np}{n-1}} \, d\nu \right)^{\frac{n-1}{np}} \leq c_{n,p} \left( \int_{\mathbb{R}^{n-1}} |h|^p \, d\mu \right)^{\frac{1}{p}}. \]

This implies for any Borel set $E \subset \mathbb{R}^{n-1}$, $\nu(E)^{\frac{n-1}{np}} \leq c_{n,p} \mu(E)^{\frac{1}{p}}$. In particular, $\nu$ is absolutely continuous with respect to $\mu$. By Radon-Nikodym theorem ([EG, section 1.6]) we have

\[ \nu(E) = \int_E gd\mu. \]
Moreover for $\mu$ a.e. $\xi \in \mathbb{R}^{n-1}$

$$g(\xi) = \lim_{r \to 0^+} \frac{\nu(B_{r/2}^{n-1}(\xi))}{\mu(B_{r}^{n-1}(\xi))}. $$

Let $J = \{\xi \in \mathbb{R}^{n-1} : \mu(\{\xi\}) > 0\}$, then $J$ is countable. Moreover, for $\xi \notin J$, we have

$$g(\xi) \leq \lim_{r \to 0^+} \inf_{r > 0} \frac{\nu}{\mu(B_{r}^{n-1}(\xi))} = 0.$$ 

Hence $\nu = \|Pf\|_{L^p}^{\frac{np}{n-1}} dx + \sum_j \nu_j \delta_{\zeta_j}$. For the third assertion, if we know $\nu(\mathbb{R}^{n-1}) \|Pf\|_{L^p}^{\frac{np}{n-1}} \geq c_{n,p} \mu(\mathbb{R}^{n-1})^{\frac{1}{p}}$, then

$$\left(\sum_j \nu_j\right)^{\frac{n-1}{n}} \geq c_{n,p} \left(\sum_j \mu_j\right)^{\frac{1}{p}} \geq \left(\sum_j \nu_j^{\frac{n-1}{n}}\right)^{\frac{1}{p}},$$

hence

$$\left(\sum_j \nu_j\right)^{\frac{n-1}{n}} \geq \sum_j \nu_j^{\frac{n-1}{n}}.$$ 

Since $0 < \frac{n-1}{n} < 1$, we see at most one $\nu_j$ is nonzero. \qed

Now we are ready to prove Theorem 3.1.

Proof of Theorem 3.1. For $r > 0$, let

$$\phi_i(r) = \sup_{\zeta \in \mathbb{R}^{n-1} \cap B_{r}^{n-1}(\xi)} |f_i|^p d\xi.$$ 

Then $\phi_i : (0, \infty) \to [0, 1]$ is a continuous nondecreasing function with

$$\lim_{r \to 0^+} \phi_i(r) = 0, \quad \lim_{r \to \infty} \phi_i(r) = 1.$$ 

By introducing dilation factor $\lambda_i$ and translation by $\zeta_i$, we may assume

$$\phi_i(1) = 1/2 = \int_{B_1} |f_i|^p d\xi.$$ 

After passing to a subsequence, we may find $f \in L^p(\mathbb{R}^{n-1})$ such that

$$f_i \to f \text{ in } L^p(\mathbb{R}^{n-1}), \quad |f_i|^p d\xi \to \mu \text{ in } \mathcal{M}(\mathbb{R}^{n-1}), \quad |Pf_i|_{L^p}^{\frac{np}{n-1}} dx \to \nu \text{ in } \mathcal{M}(\mathbb{R}^{n+1}).$$

In particular, this implies $\mu(B_1^{n-1}) \geq 1/2$. We claim $\mu(\mathbb{R}^{n-1}) = 1$. If not, then $\mu(\mathbb{R}^{n-1}) = \theta \in (0, 1)$. For $\varepsilon > 0$ small, we claim that after passing to a subsequence, we may find $r_0 > 0$ and a sequence $r_i \to \infty$ such that

$$\theta - \varepsilon < \int_{B_{r_0}^{n-1}} |f_i|^p d\xi \leq \int_{B_{r_0+2r_i}^{n-1}} |f_i|^p d\xi < \theta + \varepsilon.$$ 

Indeed, fix $r_0 > 0$ such that $\mu(B_{r_0}^{n-1}) > \theta - \varepsilon$, then for $i$ large enough, we have $\int_{B_{r_0}^{n-1}} |f_i|^p d\xi > \theta - \varepsilon$. On the other hand, since $\mu(B_{r_0+2r_i}^{n-1}) \leq \theta < \theta + \varepsilon$, we may
inductively define \( n_i > i, n_{i+1} > n_i \) such that \( \int_{B_{r_{i+2}}^{n-1}} |f_{n_i}|^p \, dx < \theta + \varepsilon \). Replacing \( f_i \) by \( f_{n_i} \) we get the needed claim. Let

\[
g_i = f_i \chi_{B_{r_0}^{n-1}}, \quad h_i = f_i \chi_{\mathbb{R}^n \setminus B_{r_0 + 2r_i}^{n-1}}.
\]

Since

\[
\int_{B_{r_0 + 2r_i}^{n-1} \setminus B_{r_0}^{n-1}} |f_i|^p \, d\xi \leq 2\varepsilon,
\]

we see

\[
|f_i - g_i - h_i|_{L^p(\mathbb{R}^n \setminus 1)} \leq c(n, p) \varepsilon^{1/p}.
\]

Note that

\[
\left| |P g_i + P h_i|^{\frac{n p}{n p - 1}} - |P g_i|^{\frac{n p}{n p - 1}} - |P h_i|^{\frac{n p}{n p - 1}} \right| \\
\leq c(n, p) \left( |P g_i|^{\frac{n p}{n p - 1}} - |P h_i|^{\frac{n p}{n p - 1}} + |P g_i| |P h_i|^{\frac{n p}{n p - 1}} \right).
\]

On the other hand,

\[
\int_{\mathbb{R}^n_+} |P g_i|^{\frac{n p}{n p - 1}} |P h_i| \, dx \\
\leq |P g_i|^{\frac{n p}{n p - 1}} L_{n p/(n p - 1)}(B_{r_0}^n) |P h_i| L_{n p/(n p - 1)}(\mathbb{R}^n_+ \setminus B_{r_0}^n) + |P g_i|^{\frac{n p}{n p - 1}} L_{n p/(n p - 1)}(\mathbb{R}^n_+ \setminus B_{r_0}^n) |P h_i|^{\frac{n p}{n p - 1}} L_{n p/(n p - 1)}(\mathbb{R}^n_+ \setminus B_{r_0}^n)
\]

\[
\leq c(n, p) R_{r_0}^{\frac{n - 1}{p}} r_i^{\frac{n - 1}{p}} + c(n, p) r_0^{(p-1)(n p-n+1)/p} \left( \frac{x_n}{\left( |x'| - r_0 \right)^2 + x_n^2} \right)^{n/2} L_{n p/(n p - 1)}(\mathbb{R}^n_+ \setminus B_{r_0}^n),
\]

this implies

\[
\limsup_{i \to \infty} \int_{\mathbb{R}^n_+} |P g_i|^{\frac{n p}{n p - 1}} |P h_i| \, dx \\
\leq c(n, p) r_0^{(p-1)(n p-n+1)/p} \left( \frac{x_n}{\left( |x'| - r_0 \right)^2 + x_n^2} \right)^{n/2} L_{n p/(n p - 1)}(\mathbb{R}^n_+ \setminus B_{r_0}^n).
\]

Let \( R \to \infty \), we see

\[
\lim_{i \to \infty} \int_{\mathbb{R}^n_+} |P g_i|^{\frac{n p}{n p - 1}} |P h_i| \, dx = 0.
\]

Similarly,

\[
\lim_{i \to \infty} \int_{\mathbb{R}^n_+} |P g_i| |P h_i|^{\frac{n p}{n p - 1}} \, dx = 0.
\]

Hence

\[
\lim_{i \to \infty} \int_{\mathbb{R}^n_+} \left| |P g_i + P h_i|^{\frac{n p}{n p - 1}} - |P g_i|^{\frac{n p}{n p - 1}} - |P h_i|^{\frac{n p}{n p - 1}} \right| \, dx = 0.
\]
Since
\[
\int_{\mathbb{R}^n_+} |P_{g_i}|^{\frac{np}{n-p}} \, dx \leq c_{n,p}^{\frac{np}{n-p}} |g_i|_{L^p(\mathbb{R}^{n-1})}^{\frac{np}{n-p}} \leq c_{n,p}^{\frac{np}{n-p}} (\theta + \varepsilon)^{\frac{n}{n-p}},
\]
and
\[
\int_{\mathbb{R}^n_+} |P_{h_i}|^{\frac{np}{n-p}} \, dx \leq c_{n,p}^{\frac{np}{n-p}} |h_i|_{L^p(\mathbb{R}^{n-1})}^{\frac{np}{n-p}} \leq c_{n,p}^{\frac{np}{n-p}} (1 - \theta + \varepsilon)^{\frac{n}{n-p}},
\]
we see
\[
c_{n,p}^{\frac{np}{n-p}} + o(1) = \int_{\mathbb{R}^n_+} |P_{f_i}|^{\frac{np}{n-p}} \, dx 
\leq \left( |P_{g_i} + P_{h_i}|_{L^{\frac{np}{n-p}}(\mathbb{R}^n_+)} + c(n,p) \varepsilon^{1/p} \right)^{\frac{np}{n-p}} 
\leq \int_{\mathbb{R}^n_+} |P_{g_i} + P_{h_i}|^{\frac{np}{n-p}} \, dx + c(n,p) \varepsilon^{1/p} 
\leq \int_{\mathbb{R}^n_+} \left( |P_{g_i}|^{\frac{np}{n-p}} + |P_{h_i}|^{\frac{np}{n-p}} \right) \, dx + c(n,p) \varepsilon^{1/p} + o(1) 
\leq c_{n,p}^{\frac{np}{n-p}} (\theta + \varepsilon)^{\frac{n}{n-p}} + c_{n,p}^{\frac{np}{n-p}} (1 - \theta + \varepsilon)^{\frac{n}{n-p}} + c(n,p) \varepsilon^{1/p} + o(1).
\]

Letting \( i \to \infty \) and then \( \varepsilon \to 0^+ \), we see
\[
1 \leq \theta^{\frac{n}{n-p}} + (1 - \theta)^{\frac{n}{n-p}}.
\]

This gives us a contradiction since \( \frac{n}{n-1} > 1 \). Hence \( \mu(\mathbb{R}^{n-1}) = 1 \). Next we claim \( \nu(\mathbb{R}^{n-1}) = c_{n,p}^{\frac{np}{n-1}} \). Indeed, for any \( \varepsilon > 0 \) small, we may find \( r > 0 \) such that \( \mu(B_r^{n-1}) > 1 - \varepsilon \), this implies \( \int_{B_r^{n-1}} |f_i|^p \, dx > 1 - \varepsilon \) when \( i \) is large enough. Hence \( \int_{\mathbb{R}^{n-1} \setminus B_r^{n-1}} |f_i|^p \, dx \leq \varepsilon \). Let \( g_i = f_i \chi_{B_r^{n-1}} \) and \( h_i = f_i \chi_{\mathbb{R}^{n-1} \setminus B_r^{n-1}} \), then
\[
|P_{h_i}|_{L^{\frac{np}{n-p}}(\mathbb{R}^n_+)} \leq c(n,p) \varepsilon^{1/p},
\]
and
\[
|(P_{g_i})(x)| \leq c(n,p) r^{\frac{(n-1)(p-1)}{p}} \frac{x_n}{\left[ (|x'| - r)^+ + x_n^2 \right]^{n/2}}.
\]

This implies
\[
\int_{\mathbb{R}^n \setminus B_r^{n-1}} |P_{f_i}|^{\frac{np}{n-p}} \, dx \leq c(n,p) \varepsilon^{\frac{n}{n-p}} + c(n,p) r^{n(p-1)} \frac{x_n}{\left[ (|x'| - r)^+ + x_n^2 \right]^{n/2}}.
\]
Taking a limit for \( i \to \infty \), we see
\[
\nu \left( \mathbb{R}^n_+ \right) \geq \nu \left( B_R^+ \right)
\]
\[
\geq \frac{n p}{c_{n,p}} - c(n,p) \frac{p}{n-1} - c(n,p) \frac{p(n-1)}{n}
\]
\[
\left\{ \frac{x_n}{\left( \left( |x'| - r \right)^+ \right)^{2} + x_n^2} \right\}^{n/2}_{L^{np} \left( \mathbb{R}^n \setminus B_R^+ \right)}
\].

let \( R \to \infty \) then \( \varepsilon \to 0^+ \), we see \( \nu \left( \mathbb{R}^n_+ \right) = \frac{n p}{c_{n,p}} \).

By Proposition 3.1 we know there exists a countable set of points \( \zeta_j \in \mathbb{R}^{n-1} \) such that
\[
\nu = |Pf|_{n/p} dx + \sum_j \nu_j \delta_{\zeta_j}, \quad \mu \geq |f|^p dx + \sum_j \mu_j \delta_{\zeta_j},
\]
here \( \mu_j = \mu \left( \{ \zeta_j \} \right) \) and
\[
\nu_j \leq c_{n,p} \mu_j^{1/2}.
\]
If \( f = 0 \), then \( \nu \left( \mathbb{R}^{n-1} \right) = \frac{n p}{c_{n,p}} \) and hence \( \nu \left( \mathbb{R}^{n-1} \right) \frac{n p}{c_{n,p}} = \frac{n p}{c_{n,p}} \frac{p}{n} \). This
implies for some \( \zeta_1 \in \mathbb{R}^{n-1} \), \( \nu = \frac{n p}{c_{n,p}} \delta_{\zeta_1} \). In particular, \( \mu \left( \{ \zeta_1 \} \right) \geq 1 \) and this
implies \( \mu = \delta_{\zeta_1} \). But
\[
\int_{B_R^{n-1} \left( \zeta_1 \right)} |f| dx \leq 1/2
\]
implies \( \mu \left( B_R^{n-1} \left( \zeta_1 \right) \right) \leq 1/2 \). This gives us a contradiction. Hence \( f \neq 0 \). Now
\[
\frac{n p}{c_{n,p}} = |Pf|_{L^{np} \left( \mathbb{R}^n \right)} + \sum_j \mu_j \leq c_{n,p} \frac{n p}{c_{n,p}} |f|_{L^{np} \left( \mathbb{R}^n \right)} + c_{n,p} \sum_j \mu_j \frac{n}{n-1},
\]
hence
\[
1 \leq |f|_{L^{np} \left( \mathbb{R}^n \right)} + \sum_j \mu_j \frac{n}{n-1}.
\]
But since
\[
1 \geq |f|_{L^{np} \left( \mathbb{R}^n \right)} + \sum_j \mu_j
\]
and \( \frac{n}{n-1} > 1 \), we see \( \mu_j = 0 \) and \( |f|_{L^{np} \left( \mathbb{R}^n \right)} = 1 \). This implies \( f \to f \) in \( L^p \left( \mathbb{R}^n \right) \).

4. The existence of maximizing functions for sharp inequalities by symmetrization

Following Lieb ([Li2]), using the method of symmetrization we will show all the
maximizers of variational problem (3.1) are radial symmetric with respect to some
point and we will give another approach to the existence of maximizing functions.

Let \( u \) be a measurable function on \( \mathbb{R}^n \), the symmetric rearrangement of \( u \) is
the nonnegative lower semi-continuous radial decreasing function \( u^* \) which has the
same distribution as \( u \). It satisfies the following important Riesz rearrangement
inequality ([Li3, p87]): for any nonnegative measurable functions \( u, v, w \) on \( \mathbb{R}^n \), we have
\[
\int_{\mathbb{R}^n} dx \int_{\mathbb{R}^n} u(x) v(y-x) w(y) dy \leq \int_{\mathbb{R}^n} dx \int_{\mathbb{R}^n} u^*(x) v^*(y-x) w^*(y) dy.
\]
Using the fact \(|w|_{L^p(\mathbb{R}^n)} = |w^*|_{L^p(\mathbb{R}^n)}\) for \(p > 0\), we see for \(1 \leq p \leq \infty\),
\[|u * v|_{L^p(\mathbb{R}^n)} \leq |u^* * v^*|_{L^p(\mathbb{R}^n)}.\]
Moreover if \(u\) is nonnegative radial symmetric and strictly decreasing in the radial direction, \(v\) is nonnegative, \(1 < p < \infty\) and
\[|u * v|_{L^p(\mathbb{R}^n)} = |u * v^*|_{L^p(\mathbb{R}^n)} < \infty,\]
then for some \(x_0 \in \mathbb{R}^n\), we have \(v(x) = v^*(x - x_0)\).

Indeed, we may assume \(v\) is not identically zero. Choose a nonnegative \(w \in L^p(\mathbb{R}^n)\) with \(|w|_{L^p(\mathbb{R}^n)} = 1\) such that
\[|u * v|_{L^p(\mathbb{R}^n)} = \int_{\mathbb{R}^n} (u * v)(y) w(y) dy.\]
Then we have
\[
|u * v|_{L^p(\mathbb{R}^n)} = \int_{\mathbb{R}^n} dx \int_{\mathbb{R}^n} u(x) v(y - x) w(y) dy \\
\leq \int_{\mathbb{R}^n} dx \int_{\mathbb{R}^n} u(x) v^*(y - x) w^*(y) dy \\
= \int_{\mathbb{R}^n} (u * v^*)(y) w^*(y) dy \\
\leq |u * v^*|_{L^p(\mathbb{R}^n)} = |u * v|_{L^p(\mathbb{R}^n)},
\]
hence all the inequalities become equalities. It follows from the Lieb’s strong version of Riesz rearrangement inequality ([Li1]) that for some \(x_0 \in \mathbb{R}^n\), \(v(x) = v^*(x - x_0)\).

**Theorem 4.1.** Assume \(n \geq 2\) and \(1 < p < \infty\), then the value
\[
\overline{c}_{n,p} = \sup \left\{ \int_{\mathbb{R}^n_+} |Pf|^{\frac{np}{n-2}} dx : f \in L^p(\mathbb{R}^{n-1}), |f|_{L^p(\mathbb{R}^{n-1})} = 1 \right\},
\]
is attained by some functions. After multiplying by a nonzero constant, every maximizer \(f\) is nonnegative, radial symmetric with respect to some point, strictly decreasing in the radial direction and it satisfies
\[
f(\xi)^{p-1} = \int_{\mathbb{R}^n_+} P(x, \xi) (Pf)(x)^{\frac{np}{n-2}-1} dx.
\]
If \(n \geq 3\) and \(p = \frac{2(n-1)}{n-2}\), then any maximizer must be of the form
\[
f(\xi) = c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{\frac{n-2}{2}}
\]
for some \(\lambda > 0\), \(\xi_0 \in \mathbb{R}^{n-1}\). In particular, \(c_{n, \frac{2(n-1)}{n-2}} = n^{-\frac{n-2}{2}} \omega_n^{-\frac{n-2}{2(n-1)}}\).

If \(n \geq 3\) and \(p = \frac{2(n-1)}{n}\), then any maximizer must be of the form
\[
f(\xi) = c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{\frac{2}{2}}
\]
for some \(\lambda > 0\), \(\xi_0 \in \mathbb{R}^{n-1}\). In particular, \(c_{n, \frac{2(n-1)}{n}} = \frac{1}{\sqrt{2(n-2)}} \phi^{(n-2)!} \left( \frac{(n-2)!}{\Gamma\left(\frac{2}{n-2}\right)} \right)^{\frac{2}{n-1}}\).
Proof. Assume $f_i$ is a maximizing sequence. Since $|f_i|^p_{L^p(\mathbb{R}^{n-1})} = |f_i|_{L^p(\mathbb{R}^{n-1})} = 1$ and
\[
|Pf_i|^\frac{np}{n-1} (\mathbb{R}^n) = \int_0^\infty |P_{x_n} f_i|^\frac{np}{n-1} (\mathbb{R}^{n-1}) \, dx_n
\]
\[
\leq \int_0^\infty |P_{x_n} f_i^*|^\frac{np}{n-1} (\mathbb{R}^{n-1}) \, dx_n = |Pf_i|^\frac{np}{n-1} (\mathbb{R}^n),
\]
we see $f_i^*$ is again a maximizing sequence. Hence we may assume $f_i$ is a nonnegative radial decreasing function.

For any $f \in L^p (\mathbb{R}^{n-1})$ and any $\lambda > 0$, we let $f^\lambda (\xi) = \lambda^{-\frac{n-1}{p}} f \left( \frac{\xi}{\lambda} \right)$, then it is clear that $|f^\lambda|_{L^p(\mathbb{R}^{n-1})} = |f|_{L^p(\mathbb{R}^{n-1})}$ and $|Pf^\lambda|_{L^n(\mathbb{R}^n)} = |Pf|_{L^n(\mathbb{R}^n)}$. For convenience, denote $e_1 = (1, 0, \cdots, 0) \in \mathbb{R}^n$ and
\[
a_i = \sup_{\lambda > 0} f_i^\lambda (e_1) = \sup_{\lambda > 0} \lambda^{-\frac{n-1}{p}} f_i \left( \frac{e_1}{\lambda} \right).
\]
It follows that
\[
0 \leq f_i (\xi) \leq a_i |\xi|^{-\frac{n-1}{p}}
\]
and hence
\[
|f_i|_{L^p, \infty(\mathbb{R}^{n-1})} \leq \omega_1^{1/p} a_i.
\]
Now
\[
|Pf_i|_{L^n(\mathbb{R}^n)} \leq c(n, p) |f_i|_{L^n(\mathbb{R}^n)} \leq c(n, p) |f_i|_{L^p(\mathbb{R}^n)}^{\frac{n-1}{np}} |f_i|^{\frac{1}{p}}_{L^p, \infty(\mathbb{R}^{n-1})} \leq c(n, p) a_i^{1/n},
\]
this implies $a_i \geq c(n, p) > 0$. We may choose $\lambda_i > 0$ such that $f_i^\lambda_i (e_1) \geq c(n, p) > 0$. Replacing $f_i$ by $f_i^{\lambda_i}$ we may assume $f (e_1) \geq c(n, p) > 0$. On the other hand, since $f_i$ is nonnegative radial decreasing and $|f_i|_{L^p(\mathbb{R}^{n-1})} = 1$, we see
\[
|f_i (\xi)| \leq \omega_1^{-1/p} |\xi|^{-(n-1)/p}.
\]
Hence after passing to a subsequence, we may find a nonnegative radial decreasing function $f$ such that $f_i \rightharpoonup f$ a.e.. It follows that $f (\xi) \geq c(n, p) > 0$ for $|\xi| \leq 1$, $f_i \rightharpoonup f$ in $L^p (\mathbb{R}^{n-1})$ and $|f|_{L^p(\mathbb{R}^{n-1})} \leq 1$. Since
\[
\int_{\mathbb{R}^{n-1}} ||f_i|^p - |f|^p - |f_i - f|^p | \, d\xi \to 0,
\]
we see
\[
|f_i - f|_{L^p(\mathbb{R}^{n-1})}^p = |f_i|_{L^p(\mathbb{R}^{n-1})}^p - |f|_{L^p(\mathbb{R}^{n-1})}^p + o(1)
\]
\[
= 1 - |f_i|_{L^p(\mathbb{R}^{n-1})}^p + o(1).
\]
On the other hand, since $(P f_i) (x) \rightharpoonup (P f) (x)$ for $x \in \mathbb{R}^n_+$ and $|P f_i|_{L^n(\mathbb{R}^n)} \leq c_{n, p}$, we see
\[
|Pf_i|_{L^n(\mathbb{R}^n)} \leq |Pf|_{L^n(\mathbb{R}^n)} + |Pf_i - Pf|_{L^n(\mathbb{R}^n)} + o(1)
\]
\[
\leq c_{n, p} |f|_{L^p(\mathbb{R}^{n-1})} + c_{n, p} |f_i - f|_{L^p(\mathbb{R}^{n-1})} + o(1).
\]
Hence
\[ 1 \leq |f|^{n_p}_{L^p(\mathbb{R}^{n-1})} + |f_i - f|^n_{L^p(\mathbb{R}^{n-1})} + o(1). \]
Let \( i \to \infty \), we see
\[ 1 \leq |f|^{n_p}_{L^p(\mathbb{R}^{n-1})} + \left(1 - |f|^n_{L^p(\mathbb{R}^{n-1})}\right)^{n_p}. \]
Since \( \frac{n}{n-1} > 1 \) and \( f \neq 0 \), we see \( |f|^{n_p}_{L^p(\mathbb{R}^{n-1})} = 1 \). Hence \( f_i \to f \) in \( L^p \left( \mathbb{R}^{n-1} \right) \) and \( f \) is a maximizer. This implies the existence of an extremal function.

Assume \( f \in L^p \left( \mathbb{R}^{n-1} \right) \) is a maximizer, then so is \( |f| \). Hence \( |P f|^{n_p}_{L^{np} \left( \mathbb{R}^{n-1} \right)} = |P f|^{n_p}_{L^{np} \left( \mathbb{R}^{n-1} \right)} \). On the other hand, since \( |(Pf)(x)| \leq P \left(|f|\right)(x) \) for \( x \in \mathbb{R}^n_+ \), we see \( |Pf| = P \left(|f|\right) \) and this implies either \( f \geq 0 \) or \( f \leq 0 \). Assume \( f \geq 0 \), then the Euler-Lagrange equation is given by
\[ \int_{\mathbb{R}^n_+} P \left(x, \xi\right) (Pf) \left(x\right)^{\frac{n_p}{np}} - 1 \, dx = c \cdot f \left(\xi\right)^{p-1}. \]
Here \( c \) is a constant. Using the fact \( |f|^{n_p}_{L^p(\mathbb{R}^{n-1})} = 1 \), we see
\[ c = |P f|^{n_p}_{L^{np} \left( \mathbb{R}^{n-1} \right)} = e^{n_p}_{n, p}. \]
After scaling by a positive constant we get
\[ \int_{\mathbb{R}^n_+} P \left(x, \xi\right) (Pf) \left(x\right)^{\frac{n_p}{np}} - 1 \, dx = f \left(\xi\right)^{p-1}. \]
On the other hand, we know for \( x_n > 0 \), \( |P_{x_n} \ast f|^{n_p}_{L^{np} \left( \mathbb{R}^{n-1} \right)} = |P_{x_n} \ast f^\ast|^{n_p}_{L^{np} \left( \mathbb{R}^{n-1} \right)} \), this implies \( f \left(\xi\right) = f^\ast \left(\xi - \xi_0\right) \) for some \( \xi_0 \). It follows from the Euler-Lagrange equation that \( f \) must be strictly decreasing along the radial direction.

For the case when \( p = \frac{2(n-1)}{n-2} \), we first observe that if \( f \in L^{2(n-1)} \left( \mathbb{R}^{n-1} \right) \), let \( u = Pf \), \( \tilde{f} \left(\xi\right) = \frac{1}{\left|\xi\right|^{n-2}} f \left(\frac{\xi}{\left|\xi\right|}\right) \) and \( \tilde{u} \left(x\right) = \frac{1}{\left|x\right|^{n-2}} u \left(\frac{x}{\left|x\right|}\right) \), then we have \( \tilde{u} = P \tilde{f} \),
\[ \left|\tilde{f}\right|^{\frac{2(n-1)}{n-2}}_{L^{\frac{2(n-1)}{n-2}} \left( \mathbb{R}^{n-1} \right)} = \left|f\right|^{\frac{2(n-1)}{n-2}}_{L^{\frac{2(n-1)}{n-2}} \left( \mathbb{R}^{n-1} \right)} \quad \text{and} \quad \left|\tilde{u}\right|^{\frac{2(n-1)}{n-2}}_{L^{\frac{2(n-1)}{n-2}} \left( \mathbb{R}^{n-1} \right)} = \left|u\right|^{\frac{2(n-1)}{n-2}}_{L^{\frac{2(n-1)}{n-2}} \left( \mathbb{R}^{n-1} \right)}. \]
This is the conformal invariance property for the particular power. As a consequence, if \( f \) is a maximizer which is nonnegative and radial, then \( \frac{1}{\left|\xi\right|^{n-2}} f \left(\frac{\xi}{\left|\xi\right|} - e_1\right) \) is a maximizer too. In particular, \( \frac{1}{\left|\xi\right|^{n-2}} f \left(\frac{\xi}{\left|\xi\right|} - e_1\right) \) is radial with respect to some point. To find such \( f \), we prove the following facts.

\textbf{Proposition 4.1.} Let \( n \geq 2 \), \( u \) be a function on \( \mathbb{R}^n \) which is radial with respect to the origin, \( 0 < u \left(x\right) < \infty \) for \( x \neq 0 \), \( e_1 = (1, 0, \cdots, 0) \), \( \alpha \in \mathbb{R} \), \( \alpha \neq 0 \). If \( v \left(x\right) = \left|x\right|^\alpha u \left(\frac{x}{\left|x\right|} - e_1\right) \) is radial with respect to some point, then either \( u \left(x\right) = \left(c_1 \left|x\right|^2 + c_2\right)^{\alpha/2} \) for some \( c_1 \geq 0 \), \( c_2 > 0 \) or
\[ u \left(x\right) = \begin{cases} c_1 \left|x\right|^\alpha, & \text{if } x \neq 0, \\ c_2, & \text{if } x = 0, \end{cases} \]
for some \( c_1 > 0 \) and \( c_2 \), an arbitrary number.
Proof. First we observe that \( \left| \frac{x}{|x|^2} - e_1 \right| = 1 \) if and only if \( x_1 = \frac{1}{2} \). For \( r > 0, r \neq 1 \), we have \( \left| \frac{x}{|x|^2} - e_1 \right| = r \) if and only if \( x \in \partial B_{\frac{r}{|x|^2}} \left( \frac{e_1}{1-r} \right) \). By scaling, we may assume \( u(e_1) = 1 \). Then \( v \left( \frac{1}{2}, x'' \right) = \left( \frac{r}{2} + |x''|^2 \right)^{\alpha/2} \). Assume \( v \) is symmetric with respect to \( z = (z_1, z'') \). Then \( v \left( \frac{1}{2}, \cdot \right) \) is symmetric with respect to \( z'' \), hence \( z'' = 0 \).

Denote \( z = ae_1 \), we claim \( 0 \leq a \leq 1 \). If this is not the case, then we may find an \( r > 0, r \neq 1 \) such that \( a = \frac{1}{1-r} \). Now on \( \partial B_{\frac{r}{|x|^2}} \left( \frac{e_1}{1-r} \right) \), \( v(x) = |x|^\alpha u(re_1) \) and it is not a constant function, contradiction. For \( x = \left( \frac{1}{2}, x'' \right) \), we have

\[
v(x) = \left( |x - ae_1|^2 + a - a^2 \right)^{\alpha/2}.
\]

Hence

\[
v(x) = \left( |x - ae_1|^2 + a - a^2 \right)^{\alpha/2} = \left( |x|^2 - 2ax_1 + a \right)^{\alpha/2}
\]

for \( |x - ae_1| \geq \left| \frac{1}{2} - a \right| \). When \( a = \frac{1}{2} \), we see \( v(x) = \left( |x|^2 - 2ax_1 + a \right)^{\alpha/2} \) for all \( x \). This implies \( u(x) = \left( \frac{1}{2} |x|^2 + \frac{1}{2} \right)^{\alpha/2} \). Hence we assume \( a \neq \frac{1}{2} \) from now on. Without losing of generality, we assume \( 0 \leq a < \frac{1}{2} \). We claim that

\[
(4.2) \quad v(x) = \left( |x|^2 - 2ax_1 + a \right)^{\alpha/2}
\]

for all \( x \neq 0 \). To see this, we first make the following observation. Assume for some given \( r > 0, r \neq 1 \) and for some \( y \in \partial B_{\frac{r}{|x|^2}} \left( \frac{e_1}{1-r} \right) \), \( (4.2) \) is true for \( y \), then it is true for all \( x \in \partial B_{\frac{r}{|x|^2}} \left( \frac{e_1}{1-r} \right) \). Indeed, for \( x \) on such a sphere, we have

\[
1 - 2ax_1 = r^2 - 1.
\]

Hence

\[
v(x) = |x|^\alpha u(re_1) = |x|^\alpha |y|^{-\alpha} \left( |y|^2 - 2ay_1 + a \right)^{\alpha/2} = |x|^\alpha \left( 1 + \frac{a(1 - 2x_1)}{|x|^2} \right)^{\alpha/2} = \left( |x|^2 - 2ax_1 + a \right)^{\alpha/2}.
\]

Note that we know \( (4.2) \) is true for \( x = te_1 \) with \( t \in (-\infty, -\frac{1}{2}] \). By the above observation we know it is also true for \( te_1 \) with \( t \in [\frac{1}{2}, 1] \). This implies it is true for \( te_1 \) with \( t \in (-\infty, -\frac{1}{2}] \). Go back we see it is true for \( te_1 \) with \( t \in [\frac{1}{2}, 1] \). Keep this procedure going, we see \( (4.2) \) is true for all \( te_1 \) with \( t \neq 0 \). Hence it is true for all \( x \neq 0 \). This implies \( u(x) = \left( a |x|^2 + 1 - a \right)^{\alpha/2} \). \( \square \)

Remark 4.1. The case when \( \alpha = 0 \) is a little bit different. However one has:

Let \( n \geq 2 \), \( u \) be a function on \( \mathbb{R}^n \) which is radial with respect to the origin, \( e_1 = (1, 0, \cdots, 0) \). If \( v(x) = u \left( \frac{x}{|x|^2} - e_1 \right) \) is radial with respect to some point, then either

\[
u(x) = \begin{cases} c_1, & \text{if } x = 0, \\ c_2, & \text{if } x \neq 0, \end{cases}
\]
or there exists \( r > 0, r \neq 1 \) such that
\[
u(x) = \begin{cases} 
  c_1, & \text{if } |x| < r, \\
  c_2, & \text{if } |x| = r, \\
  c_3, & \text{if } |x| > r.
\end{cases}
\]

Here \( c_i \)'s are arbitrary constants.

Proof of Theorem 4.1 continued. Since \( |f| \leq \frac{2(n-1)}{n-2} \) \( L^{n-2} (\mathbb{R}^{n-1}) \) = 1 and it is strictly decreasing along the radial direction, we see \( 0 < f(\xi) < \infty \) for \( \xi \neq 0 \). Note that since \( f \) satisfies the Euler-Lagrange equation, it is defined everywhere instead of almost everywhere. It follows from Proposition 4.1 that \( f(\xi) = (c_1 |\xi|^2 + c_2)^{-\frac{n-2}{2}} \) for some \( c_1, c_2 > 0 \) (note that \( f \) can not be a constant function and the scalar multiple of \( |\xi|^{2-n} \) is ruled out by the integrability). A simple change of variable shows
\[
1 = \int_{\mathbb{R}^{n-1}} f(\xi)^{\frac{2(n-1)}{n-2}} d\xi = (c_1 c_2)^{-\frac{n-1}{2}} \int_{\mathbb{R}^{n-1}} \left(1 + |\xi|^2\right)^{-\frac{n-1}{2}} d\xi,
\]
Hence \( c_1 c_2 = c(n) \). It follows that for some \( \lambda > 0 \), \( f(\xi) = c(n) \left(\frac{\lambda}{|\xi|^2 + \xi^2}\right)^{\frac{n-2}{2}} \). Let \( \epsilon_n = (0, \cdots, 0, 1) \). Since \( u(x) = |x + e_n|^{2-n} \) is a bounded harmonic function on \( \mathbb{R}_+^n \) and \( u(\xi, 0) = \left(1 + |\xi|^2\right)^{-\frac{n-2}{2}} \), we see
\[
P\left(\left(1 + |\xi|^2\right)^{-\frac{n-2}{2}}\right)(x) = |x + e_n|^{2-n}.
\]
By the dilation invariance
\[
c_n \frac{2(n-1)}{n-2} = \left\|\frac{|x + e_n|^{2-n}}{L^{\frac{2(n-1)}{n-2}} (\mathbb{R}_+^n)}\right\| = \left\|\left(1 + |\xi|^2\right)^{-\frac{n-2}{2}} \frac{2(n-1)}{n-2} \right\|_{L^{\frac{2(n-1)}{n-2}} (\mathbb{R}^{n-1})} = n^{-\frac{n-2}{n(n-1)}} \omega_n^{-\frac{n-2}{n(n-1)}}.
\]
For the case when \( p = \frac{2(n-1)}{n} \), we know any maximizer after multiplying by a constant will be nonnegative and satisfy
\[
f(\xi)^{\frac{n-2}{2}} = \int_{\mathbb{R}_+^n} P(x, \xi) (Pf)(x) dx = c(n) \int_{\mathbb{R}^{n-1}} \frac{f(\xi)}{|\xi - \xi|^{n-2}} d\zeta.
\]
Let \( g(\xi) = f(\xi)^{\frac{n-2}{2}} \), then \( g \in L^{\frac{2(n-1)}{n-2}} (\mathbb{R}^{n-1}) \) and
\[
g(\xi) = c(n) \int_{\mathbb{R}^{n-1}} \frac{g(\xi)^{\frac{n-1}{n-1}}}{|\xi - \xi|^{\frac{n-1}{n-1}}} d\zeta.
\]
It follows from [CLO2, theorem 1] or [L] that for some \( \lambda > 0 \) and \( \xi_0 \in \mathbb{R}^{n-1} \), we have
\[
g(\xi) = c(n) \left(\frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2}\right)^{\frac{n-2}{2}}.
\]
Hence
\[
f(\xi) = c(n) \left(\frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2}\right)^{\frac{n}{2}}.
\]
Since \( u(x) = \frac{x_n + 1}{|x + e_n|^{\frac{n}{2}}} \) is a bounded harmonic function on \( \mathbb{R}^{n+1}_+ \) and \( u(\xi, 0) = \left(1 + |\xi|^2\right)^{-\frac{n}{2}} \), we see

\[
P \left( \left(1 + |\xi|^2\right)^{-\frac{n}{2}} \right)(x) = \frac{x_n + 1}{|x + e_n|^{\frac{n}{2}}}.
\]

By the dilation invariance

\[
ed_n, 2(n-1) \frac{n}{m} \frac{1}{L^2(R^n)} \left| \frac{x_n + 1}{|x + e_n|^{\frac{n}{2}}} \right| = \left| \frac{1}{\sqrt{2} \pi^{(n-2)}} \frac{(n-2)!}{\Gamma \left( \frac{n+1}{2} \right)} \right|^\frac{1}{2(n-1)}.
\]

As a final note, we point out the similar statement to Proposition 4.1 in dimension one.

**Proposition 4.2.** Assume \( u \in C^3(\mathbb{R}^n), u > 0, \alpha \in \mathbb{R} \) such that for any \( y \in \mathbb{R} \), \( |x|^\alpha u \left( \frac{1}{x} + y \right) \) is symmetric with respect to some point, then for some \( a \geq 0, b > 0 \) and \( x_0 \in \mathbb{R} \), we have

\[
u(x) = \left[ a \left( x - x_0 \right)^2 + b \right]^{\alpha/2}.
\]

**Proof.** Assume \( |x|^\alpha u \left( \frac{1}{x} + y \right) \) is symmetric with respect to \( z = z(y) \), then

\[
|z|^\alpha u \left( \frac{1}{z} + y \right) = |z - x|^\alpha u \left( \frac{1}{2z - x} + y \right).
\]

Replace \( x \) by \( x^{-1} \), we see

\[
u(x + y) = |1 - 2zx|^\alpha u \left( y - \frac{x}{1 - 2zx} \right).
\]

Calculation shows

\[
|1 - 2zx|^\alpha u \left( y - \frac{x}{1 - 2zx} \right) = u(y) - \left( u'(y) + 2\alpha zu(y) \right) x + \left( \frac{u''(y)}{2} + 2(\alpha - 1) zu'(y) + 2\alpha (\alpha - 1) z^2 u(y) \right) x^2
\]

\[
- \left[ \frac{u'''(y)}{6} + (\alpha - 2) zu''(y) + 2(\alpha - 1) (\alpha - 2) z^2 u'(y) + \frac{4}{3} \alpha (\alpha - 1) (\alpha - 2) z^3 u(y) \right] x^3
\]

Comparing the Taylor expansion coefficients, we see

\[
u'(y) = -\alpha zu(y)
\]

and

\[
u''(y) = \frac{u''(y)}{3} + (\alpha - 2) zu''(y) + 2(\alpha - 1) (\alpha - 2) z^2 u'(y) + \frac{4}{3} \alpha (\alpha - 1) (\alpha - 2) z^3 u(y) = 0
\]

If \( \alpha = 0 \), then we see \( u' = 0 \) and hence \( u \) must be a constant function and we are done. Assume \( \alpha \neq 0 \), then

\[
z = \frac{u'(y)}{\alpha zu(y)}.
\]

Plug this in the second equation, we get

\[
u^2 u'' + 3 \left( \frac{2}{\alpha - 1} \right) u' u'' + \left( \frac{2}{\alpha - 1} \right) \left( \frac{2}{\alpha - 2} \right) u^3 = 0.
\]
Hence
\[ (u^{2/\alpha})^{n} = \frac{2}{\alpha} u^{\frac{2}{\alpha} - 3} [u^{2}u'' + 3 \left( \frac{2}{\alpha} - 1 \right) uu' + \left( \frac{2}{\alpha} - 1 \right) \left( \frac{2}{\alpha} - 2 \right) u^{3}] = 0. \]
The proposition follows. \( \square \)

5. Regularity of nonnegative critical functions

In this section we will study the regularity issue related to the Euler-Lagrange equation (1.9). Let \( f \) be a nonnegative function satisfying (1.9), define \( u = Pf \), then the single equation becomes an integral system
\[
\begin{align*}
u (x) &= \int_{\mathbb{R}^{n-1}} P (x, \xi) f (\xi) d\xi, \\
f (\xi)^{p-1} &= \int_{\mathbb{R}^{n}} P (x, \xi) u (x) \frac{\partial u}{\partial \xi} d\xi.
\end{align*}
\]
This system is very similar to the one appeared in the study of the sharp Hardy-Littlewood-Sobolev inequality ([Li2, part (ii) of theorem 2.3]). In [ChL, L] the regularity problem for some cases of that system was resolved by a linear approach. In [Hn], a nonlinear approach was introduced to resolve the regularity issue for all the cases. We will apply the nonlinear approach to handle (1.9).

**Theorem 5.1.** Assume \( n \geq 2, 1 < p < \infty, f \in L^{p}_{loc} (\mathbb{R}^{n-1}) \) is nonnegative, not identically zero and it satisfies
\[
f (\xi)^{p-1} = \int_{\mathbb{R}^{n}} P (x, \xi) (Pf) (x) \frac{\partial u}{\partial \xi} d\xi,
\]
then \( f \in C^{\infty} (\mathbb{R}^{n-1}) \). If we know \( f \in L^{p} (\mathbb{R}^{n-1}) \), then \( f (\xi) \to 0 \) as \( |\xi| \to \infty \).

We note that the condition \( f \in L^{p}_{loc} (\mathbb{R}^{n-1}) \) can not be dropped, since the above equation has \( c(n, p) |\xi|^{-\frac{n-1}{p}} \) as a singular solution. To prove this theorem, we first derive some local regularity results for some integral inequalities. According to the range of \( p \), we need two local results stated in Proposition 5.1 and Proposition 5.2 below. The two propositions are of the same nature as [Hn, proposition 2.1] and [L, theorem 1.3].

**Proposition 5.1.** Given \( n \geq 2, 1 < a, b \leq \infty, 1 \leq r < \infty, \frac{n}{n-1} < p < q < \infty \) such that
\[
\frac{1}{n} < \frac{r}{q} + \frac{1}{a} < \frac{r}{p} + \frac{1}{a} \leq 1
\]
and
\[
\frac{n}{ra} + \frac{n-1}{b} = \frac{1}{r}.
\]
Denote \( B_{R} = B_{R}^{n-1} \) and \( B_{R}^{+} = B_{R}^{n} \cap \mathbb{R}^{+} \). Assume \( u, v \in L^{p} (B_{R}^{+}), U \in L^{a} (B_{R}^{+}), F \in L^{b} (B_{R}) \) are all nonnegative functions with \( v|_{B_{R}} \in L^{a} (B_{R}) \),
\[
|U|_{L^{q} (B_{R}^{+})} |F|_{L^{b} (B_{R})} \leq \varepsilon (n, p, q, r, a, b) \text{ small}
\]
and
\[
u (x) \leq \int_{B_{R}} P (x, \xi) F (\xi) \left[ \int_{B_{R}} P (y, \xi) U (y) u (y)^{r} dy \right]^{1/r} d\xi + v (x)
\]
for $x \in B^+_R$, then we have $u|_{B^+_{R/4}} \in L^q \left( B^+_{R/4} \right)$ and

$$|u|_{L^q(B^+_{R/4})} \leq c(n,p,q,r,a,b) \left( R^{n-\frac{n}{q}} |u|_{L^p(B^+_R)} + |u|_{L^q(B^+_{R/4})} \right).$$

**Proof.** By scaling we may assume $R = 1$. First assume we have $u, v \in L^q \left( B^+_1 \right)$. Denote

$$f(\xi) = \int_{B^+_1} P(x,\xi) U(x) u(x)^r \, dx \text{ for } \xi \in B_1.$$ 

Let $p_1$ and $q_1$ be the numbers defined by

$$\frac{n-1}{p_1} = \frac{nr + n}{a} - 1, \quad \frac{n-1}{q_1} = \frac{nr + n}{a} - 1,$$

then it follows from Proposition 2.2 that

$$|f|_{L^{p_1}(B_1)} \leq c(n,p,r,a) |U|_{L^n(B^+_1)} |u|_{L^p(B^+_1)}^{1/r},$$

$$|f|_{L^{q_1}(B_1)} \leq c(n,q,r,a) |U|_{L^n(B^+_1)} |u|_{L^q(B^+_1)}^{1/r}.$$ 

Given $0 < s < t \leq 1/2$. For $x \in B^+_s$, we have

$$u(x) \leq \int \frac{P(x,\xi) F(\xi) f(\xi)^{1/r} \, d\xi}{B^+_{s+t/2}} + \int \frac{P(x,\xi) F(\xi) f(\xi)^{1/r} \, d\xi}{B_1 \setminus B^+_{s+t/2}} + \int \frac{c(n) (t-s)^{n-1}}{B_1 \setminus B^+_{s+t/2}} F(\xi) f(\xi)^{1/r} \, d\xi + v(x).$$

Hence

$$|u|_{L^q(B^+_s)} \leq c(n,q) |F|_{L^n(B_1)} |f|_{L^{q_1}(B^+_1)}^{1/r} + \frac{c(n,p,q,r,a)}{(t-s)^{n-1}} |u|_{L^p(B^+_1)} + |u|_{L^q(B^+_1)}. $$

On the other hand, for $\xi \in B^+_{s+t/2}$, we have

$$f(\xi) = \int \frac{P(x,\xi) U(x) u(x)^r \, dx}{B^+_s} + \int \frac{P(x,\xi) U(x) u(x)^r \, dx}{B^+_s \setminus B^+_t} + \int \frac{c(n) (t-s)^{n-1}}{B^+_s \setminus B^+_t} U(x) u(x)^r \, dx$$

It follows from Proposition 2.2 that

$$|f|_{L^{q_1}(B^+_t)} \leq c(n,q,r,a) |U|_{L^n(B^+_1)} |u|_{L^p(B^+_1)}^{1/r} + \frac{c(n,p,q,r,a)}{(t-s)^{n-1}} |U|_{L^n(B^+_1)} |u|_{L^q(B^+_1)}. $$
Combining the two inequalities together, we see
\[
|u|_{L^s(B^+_1)} \leq \frac{1}{2} |u|_{L^s(B^+_1)} + \frac{c(n, p, q, r, a)}{(t-s)^{n-1}} |u|_{L^p(B^+_1)} + |v|_{L^s(B^+_{1/2})}
\]
if $\varepsilon$ is small enough. It follows from the usual iteration procedure ([HL, lemma 4.3 on p.75]) that
\[
|u|_{L^s(B^+_{1/4})} \leq c(n, p, q, r, a) \left( |u|_{L^p(B^+_1)} + |v|_{L^s(B^+_{1/2})} \right).
\]
To prove the full proposition, we note that there exists a function $0 \leq \eta(x) \leq 1$ such that
\[
u(x) = \eta(x) \int_{B_1} P(x, \xi) F(\xi) \left[ \int_{B_1^+} P(y, \xi) U(y) u(y)\right]^{1/r} dy \xi + \eta(x) \nu(x).
\]
We may define a map $T$ by
\[
T(\varphi)(x) = \eta(x) \int_{B_1} P(x, \xi) F(\xi) \left[ \int_{B_1^+} P(y, \xi) U(y) |\varphi(y)|^{r} dy \right]^{1/r} d\xi.
\]
Note that we have
\[
|T(\varphi)|_{L^p(B^+_1)} \leq c(n, p, r, a, b) |U|_{L^s(B^+_1)}^{1/r} |F|_{L^s(B_1)} |\varphi|_{L^p(B_1)} \leq \frac{1}{2} |\varphi|_{L^p(B_1)};
\]
\[
|T(\varphi)|_{L^s(B^+_1)} \leq c(n, q, r, a, b) |U|_{L^s(B^+_1)}^{1/r} |F|_{L^s(B_1)} |\varphi|_{L^s(B_1)} \leq \frac{1}{2} |\varphi|_{L^s(B_1)}
\]
if $\varepsilon$ is small enough. Moreover, for $\varphi, \psi \in L^p(B^+_1)$, it follows from Minkowski inequality that
\[
|T(\varphi)(x) - T(\psi)(x)| \leq T(|\varphi - \psi|)(x) \text{ for } x \in B^+_1,
\]
hence
\[
|T(\varphi) - T(\psi)|_{L^p(B^+_1)} \leq |T(|\varphi - \psi|)|_{L^p(B^+_1)} \leq \frac{1}{2} |\varphi - \psi|_{L^p(B^+_1)}.
\]
Similarly we have for any $\varphi, \psi \in L^q(B^+_1),$
\[
|T(\varphi) - T(\psi)|_{L^q(B^+_1)} \leq \frac{1}{2} |\varphi - \psi|_{L^q(B^+_1)}.
\]
For $k \in \mathbb{N}$, let $v_k(x) = \min \{v(x), k\}$, then it follows from contraction mapping theorem that we may find a unique $u_k \in L^q(B^+_1)$ such that
\[
u_k(x) = T(u_k)(x) + \eta(x) v_k(x)
\]
\[
= \eta(x) \int_{B_1} P(x, \xi) F(\xi) \left[ \int_{B_1^+} P(y, \xi) U(y) |u_k(y)|^{r} dy \right]^{1/r} d\xi + \eta(x) v_k(x).
\]
Applying the apriori estimate to $u_k$, we see
\[
|u_k|_{L^q(B^+_{1/4})} \leq c(n, p, q, r, a) \left( |u_k|_{L^p(B^+_1)} + |v|_{L^s(B^+_{1/2})} \right).
\]
Observe that
\[
\nu(x) = T(u)(x) + \eta(x) v(x),
\]
we see

\[ \|u_k - u\|_{L^p(B_1)} \leq \|T(u_k) - T(u)\|_{L^p(B_1)} + |v_k - v|_{L^p(B_1)} \]

\[ \leq \frac{1}{2} \|u_k - u\|_{L^p(B_1)} + |v_k - v|_{L^p(B_1)}. \]

Hence \( |u_k - u|_{L^p(B_1)} \leq 2 |v_k - v|_{L^p(B_1)} \to 0 \) as \( k \to \infty \). Take a limit process in the apriori estimate, we get the proposition. \( \square \)

The other local regularity result is

**Proposition 5.2.** Given \( n \geq 2, 1 < a, b \leq \infty, 1 \leq r < \infty, 1 < p < q < \infty \) such that

\[ 0 < \frac{r}{p} + \frac{1}{a} < 1 \]

and

\[ \frac{n-1}{ra} + \frac{n}{b} = 1. \]

Denote \( B_R = B^{n-1}_R \) and \( B^+_R = B^n_R \cap \mathbb{R}^n_+ \). Assume \( f, g \in L^p(B_R), F \in L^q(B_R), U \in L^b(B^n_R) \) are all nonnegative functions with \( g|_{B^{1/2}_r} \in L^q(B_{R/2}), \)

\[ |F|_{L^q(B_R)} \leq \varepsilon(n,p,q,r,a,b) \text{ small} \]

and

\[ f(\xi) \leq \int_{B^n_R} P(x,\xi) U(x) \left[ \int_{B^n_R} P(x,\xi) F(\xi) f(\xi)^r \, d\xi \right]^{1/r} \, dx + g(\xi) \]

for \( \xi \in B_R \), then we have \( f|_{B_{R/4}} \in L^q(B_{R/4}) \) and

\[ |f|_{L^q(B_{R/4})} \leq c(n,p,q,r,a,b) \left( R^{\frac{n-1}{r} - \frac{n-1}{p}} |f|_{L^p(B_R)} + |g|_{L^q(B_{R/2})} \right). \]

**Proof.** By scaling, we may assume \( R = 1 \). First assume we have \( f, g \in L^q(B_1) \). Define

\[ u(x) = \int_{B_1} P(x,\xi) F(\xi) f(\xi)^r \, d\xi \]

for \( x \in B_1^+ \). Let \( p_1 \) and \( q_1 \) be the numbers given by

\[ \frac{n}{p_1} = \frac{n-1}{a} + \frac{(n-1)r}{p}, \quad \frac{n}{q_1} = \frac{n-1}{a} + \frac{(n-1)r}{q}. \]

It follows from Proposition 2.1 that

\[ |u|_{L^{p_1}(B_1^+)} \leq c(n,p,r,a) |F|_{L^{p_1}(B_1)} |f|_{L^p(B_1)}^{1/r}, \]

\[ |u|_{L^{q_1}(B_1^+)} \leq c(n,q,r,a) |F|_{L^{q_1}(B_1)} |f|_{L^q(B_1)}^{1/r}. \]

Given \( 0 < s < t \leq 1/2 \). For \( \xi \in B_s \), a similar calculation as in the proof of Proposition 5.1 shows

\[ f(\xi) \leq \int_{B^+_s} P(x,\xi) U(x) u(x)^{1/r} \, dx + \frac{c(n,p,r,a)}{(t-s)^{n-1}} |f|_{L^p(B_1)} + g(\xi). \]

Hence

\[ |f|_{L^q(B_s)} \leq c(n,q,r,b) |U|_{L^q(B_1^+)} |u|^{1/r}_{L^{q_1}(B^+_s)} + \frac{c(n,p,q,r,a)}{(t-s)^{n-1}} |f|_{L^p(B_1)} + |g|_{L^q(B_{1/2})}. \]
On the other hand, for \( x \in B^+_R \), we have

\[
  u(x) \leq \int_{B_1} P(x, \xi) F(\xi) f(\xi)^r \, d\xi + \frac{c(n, p, r, a)}{(t-s)^{n-1}} |F|_{L^s(B_1)} |f|_{L^p(B_1)}.
\]

Hence

\[
  |u|_{L^q(B^+_R)} \leq c(n, q, r, a) |F|_{L^s(B_1)} |f|_{L^p(B_1)} + \frac{c(n, p, q, r, a)}{(t-s)^{n-1}} |F|_{L^s(B_1)} |f|_{L^p(B_1)}.
\]

Combining the two inequalities together, we see

\[
  |f|_{L^q(B_1)} \leq \frac{1}{2} |f|_{L^q(B_1)} + \frac{c(n, p, q, r, a, b)}{(t-s)^{n-1}} |f|_{L^p(B_1)} + |g|_{L^s(B_1/2)}
\]

when \( \varepsilon \) is small enough. This implies

\[
  |f|_{L^q(B_1)} \leq c(n, p, q, r, a) \left( |f|_{L^p(B_1)} + |g|_{L^s(B_1/2)} \right).
\]

With this apriori estimate at hands, we may proceed in the same way as the proof of Proposition 5.1 to get the full conclusion. \( \square \)

Now we are ready to derive the main results of this section.

**Proof of Theorem 5.1.** Let \( p_0 = \frac{1}{p-1} \), \( f_0(\xi) = f(\xi)^{p_0-1} \), \( u_0(x) = (Pf)(x) \), then \( 0 < p_0 < \infty \), \( f_0 \in L^{p_0+1}_{\text{loc}}(\mathbb{R}^{n-1}) \) and

\[
  u_0(x) = \int_{\mathbb{R}^{n-1}} P(x, \xi) f_0(\xi)^{p_0} \, d\xi, \quad f_0(\xi) = \int_{\mathbb{R}^{n-1}} P(x, \xi) u_0(x)^{\frac{n}{n-1}p_0} \, dx.
\]

For \( R > 0 \), we write \( B_R = B^{n-1}_R \), \( B^+_R = B^+_R \cap \mathbb{R}^n_+ \) and

\[
  u_R(x) = \int_{\mathbb{R}^{n-1} \setminus B_R} P(x, \xi) f_0(\xi)^{p_0} \, d\xi, \quad f_R(\xi) = \int_{B^+_R \setminus B^+_R} P(x, \xi) u_0(x)^{\frac{n}{n-1}p_0} \, dx.
\]

First we want to show \( u_0 \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(\mathbb{R}^n_+) \) and \( u_R \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(B^+_R \cup B^{-1}_R) \).

Indeed, since \( f_0 \in L^{p_0+1}_{\text{loc}}(\mathbb{R}^{n-1}) \), we see \( f_0 < \infty \) a.e. on \( \mathbb{R}^{n-1} \). This implies \( u_0 < \infty \) a.e. on \( \mathbb{R}^n_+ \). Hence there exists an \( x_0 \in B^+_R \) such that \( u_0(x_0) < \infty \). It follows that \( \int_{\mathbb{R}^{n-1} \setminus B_R} f_0(\xi)^{p_0} \left( \frac{f_0(\xi)^{p_0}}{|\xi|^n} \right)^{1/2} d\xi < \infty \) and \( \int_{\mathbb{R}^{n-1} \setminus B_R} \frac{f_0(\xi)^{p_0}}{|\xi|^n} d\xi < \infty \). For \( 0 < \theta < 1 \), \( x \in B^+_R \), we have

\[
  u_R(x) = \int_{\mathbb{R}^{n-1} \setminus B_R} P(x, \xi) f_0(\xi)^{p_0} \, d\xi \leq \frac{c(n) R}{(1-\theta)^n} \int_{\mathbb{R}^{n-1} \setminus B_R} f_0(\xi)^{p_0} \left| \frac{f_0(\xi)^{p_0}}{|\xi|^n} \right| d\xi.
\]

It follows that \( u_R \in L^{\infty}_{\text{loc}}(B^+_R \cup B^{-1}_R) \). Since \( \int_{B_R} P(\cdot, \xi) f_0(\xi)^{p_0} \, d\xi \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(\mathbb{R}^n_+) \), we know \( u_0 \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(B^+_R \cup B^{-1}_R) \). By choosing \( R \) arbitrarily large, we deduce that \( u_0 \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(\mathbb{R}^n_+) \) and hence \( u_R \in L^{\frac{n(n-1)p_0+1}{n(p_0+1)}}_{\text{loc}}(B^+_R) \).
Next we want to show $f_R \in L^{p_0+1}(B_R)\cap L^{\infty}_{loc}(B_R)$. Indeed we may find $\xi_0 \in B_R$ such that $\int_{B^+_R} P(x,\xi_0) u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx < \infty$. This implies

$$\int_{B^+_R \setminus B^+_R} \frac{x_n}{|x' - \xi_0|^2 + x_n^2} u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx < \infty$$

and hence $\int_{B^+_R \setminus B^+_R} \frac{x_n}{|x'|^2 + x_n^2} u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx < \infty$. For $0 < \theta < 1$, $\xi \in B_{\theta R}$, we have

$$f_R(\xi) = \int_{B^+_R \setminus B^+_R} P(x,\xi) u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx \leq \frac{c(n)}{1 - \theta} \int_{B^+_R \setminus B^+_R} \frac{x_n}{|x'|^n} u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx$$

and hence $f_R \in L^{\infty}_{loc}(B_R)$. To prove the regularity of $f$, we discuss two cases.

**Case 5.1.** $0 < p_0 \leq \frac{n}{n-1}$.

In this case, we have $\frac{p_0+n}{(n-1)p_0} > 1$. Fix a number $r$ such that

$$1 \leq r < \frac{p_0 + n}{(n - 1)p_0} \quad \text{and} \quad r > \frac{1}{p_0},$$

then

$$f_0(\xi)^{1/r} \leq \left( \int_{B^+_R} P(x,\xi) u_0(x)^{\frac{p_0+n}{(n-1)p_0}} dx \right)^{1/r} + f_R(\xi)^{1/r}.$$

Hence

$$u_0(x) = \int_{B_R} P(x,\xi) f_0(\xi)^{p_0+r-1} f_0(\xi)^{1/r} d\xi + u_R(x)$$

$$\leq \int_{B_R} P(x,\xi) f_0(\xi)^{p_0+r-1} \left( \int_{B^+_R} P(y,\xi) u_0(y)^{\frac{p_0+n}{(n-1)p_0}} u_0(y)^r dy \right)^{1/r} d\xi + v_R(x),$$

here

$$v_R(x) = \int_{B_R} P(x,\xi) f_0(\xi)^{p_0+r-1} f_R(\xi)^{1/r} d\xi + u_R(x).$$

Since $f_R \in L^{p_0+1}(B_R)$, we see $v_R \in L^{\frac{n(p_0+1)}{(n-1)p_0}}(B^+_R)$. On the other hand, for $0 < \theta < 1$, $x \in B^+_{\theta R}$, we have

$$\int_{B_R} P(x,\xi) f_0(\xi)^{p_0+r-1} f_R(\xi)^{1/r} d\xi$$

$$\leq \frac{|f_R|^{1/r}}{L^\infty(B_{1+\theta R})} \int_{B_{1+\theta R}} P(x,\xi) f_0(\xi)^{p_0+r-1} d\xi$$

$$+ \frac{c(n)}{1 - \theta} R^{(n-1)p_0} \int_{B_R \setminus B_{1+\theta R}} f_0(\xi)^{p_0+r-1} f_R(\xi)^{1/r} d\xi$$

$$\leq \frac{|f_R|^{1/r}}{L^\infty(B_{1+\theta R})} \int_{B_{1+\theta R}} P(x,\xi) f_0(\xi)^{p_0+r-1} d\xi + \frac{c(n,p_0)}{(1 - \theta)^n R^{\frac{1}{p_0} + \frac{p_0+n}{(n-1)p_0}}} |f_0|^{p_0}_{L^{p_0+1}(B_R)).}$$
hence \( v_R \in L^{(n-1)(p_0-r-1)}_{\text{loc}}(B^+_R \cup B^{n-1}_R) \). Let \( a = \frac{n(p_0 + 1)}{p_0 + n - (n - 1)p_0r} \), \( b = \frac{(p_0 + 1)r}{p_0r - 1} \).

Then \( \frac{n}{ra} + \frac{n - 1}{b} = \frac{1}{r} \) and

\[
\frac{r}{n(p_0 + 1)} + \frac{1}{a} = \frac{p_0 + n}{n(p_0 + 1)} < 1.
\]

For \( \frac{n(p_0 + 1)}{(n-1)p_0} < q < \frac{n(p_0 + 1)}{(n-1)(p_0-r-1)} \), we have \( \frac{q}{a} + \frac{1}{n} > \frac{1}{r} \). It follows from Proposition 5.1 that \( u_0|_{B^+_R} \in L^{q} \left( B^+_R \right) \). This implies

\[
f_0(\xi) = \int_{B^+_R / \frac{1}{4}} P(x, \xi) u_0(x) \left( \frac{p_0 + n}{(n-1)p_0} \right)^{p_0 + n} dx + f_{R/4}(\xi) \leq c(n, q) u_0 \frac{(n-1)p_0}{(n-1)(p_0-r-1)} + f_{R/4}(\xi)
\]

when \( q > \frac{n(p_0 + n)}{(n-1)p_0} \). Such a choice of \( q \) is possible since \( \frac{n(p_0 + 1)}{(n-1)(p_0-r-1)} > \frac{n(p_0 + n)}{(n-1)p_0} \).

In particular, we see \( f_0|_{B_{R/8}} \in L^{\infty}(B_{R/8}) \). Since every point may be viewed as a center, we see \( f_0 \in L^{\infty}_{\text{loc}}(\mathbb{R}^{n-1}) \) and hence \( u_0 \in L_{\text{loc}}^{\infty}(\mathbb{R}^n_{+}) \). For any \( R > 0 \), since

\[
\int_{\mathbb{R}^{n-1} \setminus B_R} \frac{f_0(\xi)p_0}{|\xi|^n} d\xi < \infty \quad \text{and} \quad \int_{\mathbb{R}^n_{+} \setminus B^+_R} |x|^n u_0(x) \left( \frac{p_0 + n}{(n-1)p_0} \right)^{p_0 + n} dx < \infty,
\]

we see \( u_R \in C^{\infty}(B^+_R \cup B^{n-1}_R) \) and \( f_R \in C^{\infty}(B_R) \). It follows that \( f_0 \in C^{\alpha}_{\text{loc}}(\mathbb{R}^{n-1}) \) for \( 0 < \alpha < 1 \). In particular, \( f_0(\xi) > 0 \) for any \( \xi \in \mathbb{R}^{n-1} \). This implies \( u_0 \in C^{\alpha}_{\text{loc}}(\mathbb{R}^n_{+}) \) for any \( 0 < \alpha < 1 \). Using the fact \( \partial_2 \log |x| = x_2 |x|^{-2} \) when \( n = 2 \), \( \partial_\nu |x|^{2-n} = (2-n)x_n |x|^{-n} \) when \( n \geq 3 \) and the standard potential theory in [GT, chapter 4], it follows from bootstrap method that both \( u_0 \) and \( f_0 \) are smooth. If \( f \in L^p(\mathbb{R}^{n-1}) \), then \( f_0 \in L^{p_0 + 1}(\mathbb{R}^{n-1}) \) and \( u_0 \in L^{\frac{n(p_0+1)}{(n-1)p_0}}(\mathbb{R}^n_{+}) \). If we go back to the proof with this fact and apply Holder inequality when necessary, we will get \( f_0 \in L^{\infty}(\mathbb{R}^{n-1}) \) and \( u_0 \in L^{\infty}(\mathbb{R}^n_{+}) \). This implies \( \frac{(n-1)p_0}{p_0 + n} \leq s \leq \frac{\log n}{n-1} \) for \( \frac{n(p_0 + 1)}{p_0 + n} \leq s \leq \frac{n}{n-1} \). Denote

\[
U = \frac{x_n}{|x|^n} \ast \left( u_0 \frac{p_0 + n}{(n-1)p_0} \chi_{\mathbb{R}^n_{+}} \right) = \left( \frac{x_n}{|x|^n} \chi_{B^+_1} \right) \ast \left( u_0 \frac{p_0 + n}{(n-1)p_0} \chi_{\mathbb{R}^n_{+}} \right) + \left( \frac{x_n}{|x|^n} \chi_{\mathbb{R}^n_{+} \setminus B^+_1} \right) \ast \left( u_0 \frac{p_0 + n}{(n-1)p_0} \chi_{\mathbb{R}^n_{+}} \right) .
\]

Since \( \frac{x_n}{|x|^n} \chi_{B^+_1} \in L^{\frac{n}{n-1} - \varepsilon}(\mathbb{R}^n) \), \( \frac{x_n}{|x|^n} \chi_{\mathbb{R}^n_{+} \setminus B^+_1} \in L^{\frac{n}{n-1} + \varepsilon}(\mathbb{R}^n) \) and \( \frac{n(p_0 + 1)}{p_0 + n} < n \), we see \( U \) is continuous and \( U(x) \to 0 \) as \( |x| \to \infty \). It follows from \( f_0 = c(n) U|_{\mathbb{R}^{n-1}} \) that \( f_0(\xi) \to 0 \) as \( |\xi| \to \infty \).

**Case 5.2.** \( \frac{1}{n-1} \leq p_0 < \infty \).

In this case, we fix a number \( r \) such that

\[
1 \leq r \leq p_0 \quad \text{and} \quad r \geq \left( \frac{n-1}{p_0} \right)^{p_0}.
\]
then
\[ u_0(x)^{1/r} \leq \left( \int_{B_R^+} P(x, \xi) f_0(\xi)^{p_0} \, d\xi \right)^{1/r} + u_R(x)^{1/r}. \]

Hence
\[ f_0(\xi) \leq \int_{B_R^+} P(x, \xi) u_0(x)^{p_0 + n \nu} (\xi)^{-r-1} \left( \int_{B_R^+} P(x, \xi) f_0(\xi)^{p_0 - r} f_0(\xi)^r \, d\xi \right)^{1/r} \, dx + g_R(\xi), \]

here
\[ g_R(\xi) = \int_{B_R^+} P(x, \xi) u_0(x)^{p_0 + n \nu} (\xi)^{-r-1} u_R(x)^{1/r} \, dx + f_R(\xi). \]

Since \( u_R \in L^{p_0 + 1}(B_R^+) \), we see \( g_R \in L^{p_0 + 1}(B_R^+) \). On the other hand, for \( 0 < \theta < 1, \xi \in B_{R^R} \), we have
\[
\begin{align*}
|u_R|^{1/r} & \quad L^{\infty}\left(B_{1+\theta \rho}^{p_0 + 1}(B_{R^R}) \right) \quad |P(x, \xi) u_0(x)^{p_0 + n \nu} (\xi)^{-r-1} | \quad dx \\
& \quad + \frac{c(n)}{\theta^n R^{n-1}} \int_{B_R^+ \setminus B_{1+\theta \rho}^{p_0 + 1}(B_{R^R})} u_0(x)^{p_0 + n \nu} (\xi)^{-r-1} u_R(x)^{1/r} \, dx \\
& \leq |u_R|^{1/r} L^{\infty}\left(B_{1+\theta \rho}^{p_0 + 1}(B_{R^R}) \right) \quad |P(x, \xi) u_0(x)^{p_0 + n \nu} (\xi)^{-r-1} | \quad dx \\
& \quad + \frac{c(n, p_0)}{\theta^n R^{n-1}} L^{p_0 + 1}(B_{R^R}) \right) \, dx
\end{align*}
\]

hence \( g_R \in L^{q}_{loc}(B_R) \) for any \( q < \infty \). Let
\[
a = \frac{p_0 + 1}{p_0 - r}, \quad b = \frac{n (p_0 + 1)}{(p_0 + n) r - (n - 1) p_0},
\]
then \( \frac{\nu + n}{\nu + 1} = 1, \frac{p_0 + 1}{p_0 r + 1} + \frac{n}{\nu + 1} = \frac{p_0}{p_0 + 1} \in (0, 1) \). For any \( p_0 + 1 < q < \infty \), it follows from Proposition 5.2 that when \( R \) is small enough, we have \( f_0 \in L^{q}(B_{R/4}) \).

Since every point can be viewed as a center, we see \( f_0 \in L^{q}_{loc}(\mathbb{R}^{n-1}) \) and hence \( u_0 \in L^{\infty}_{loc}(\mathbb{R}^{n-1}) \). Using the equations of \( f_0 \) and \( u_0 \), we see \( f_0 \in L^{\infty}_{loc}(\mathbb{R}^{n-1}) \) and \( u_0 \in C^{\infty}_{loc}(\mathbb{R}^{n+1+}) \). Now the arguments in Case 5.1 tell us \( f_0 \in C^{\infty}(\mathbb{R}^{n+1}) \) and \( u_0 \in C^{\infty}(\mathbb{R}^{n+1}) \), moreover, \( f_0(\xi) \to 0 \) as \( |\xi| \to \infty \) under the assumption \( f \in L^{p}(\mathbb{R}^{n-1}) \). \( \square \)

6. Radial symmetry of nonnegative critical functions

In this section we will study the symmetry property of the nonnegative critical functions of the variational problem (1.8). We will show any nonnegative critical functions are radial symmetric with respect to some point. As explained at the beginning of Section 5, (1.9) may be viewed as an integral system which is very similar to the integral systems related to the Hardy-Littlewood-Sobolev inequalities. For the latter one, the radial symmetry of nonnegative solution for some special cases were solved in [CLO1, CLO2, L]. In particular, in [CLO2] an integral version
of the method of moving planes ([GNN]) was introduced and later applied in [CLO1] to resolve the symmetry problems for some cases of the integral systems related to Hardy-Littlewood-Sobolev inequalities. In [Hn], some new observations were added and all the cases for the symmetry of the solutions to the systems were resolved. We will apply these new observations to (1.9).

**Theorem 6.1.** Assume $1 < p < \infty$, $n \geq 2$, $f \in L^p(\mathbb{R}^{n-1})$ is nonnegative, not identically zero and it satisfies

$$f(\xi)^{p-1} = \int_{\mathbb{R}^n_+} P(x, \xi)(Pf)(x)^{\frac{np}{n-p+1}} \, dx,$$

then $f \in C^\infty(\mathbb{R}^{n-1})$, moreover $f$ is radial symmetric with respect to some point and strictly decreasing along the radial direction.

For the case $n \geq 3$, $p = \frac{2(n-1)}{n-2}$, the Euler-Lagrange equation has conformal invariance property and we may weaken the assumption a little bit.

**Proposition 6.1.** Assume $n \geq 3$, $f \in L^{\frac{2(n-1)}{n-2}}(\mathbb{R}^{n-1})$ is nonnegative, not identically zero and it satisfies

$$f(\xi)^{\frac{n-2}{n-1}} = \int_{\mathbb{R}^n_+} P(x, \xi)(Pf)(x)^{\frac{n+2}{n-2}} \, dx,$$

then for some $\lambda > 0$ and $\xi_0 \in \mathbb{R}^{n-1}$, we have

$$f(\xi) = c(n) \left( \frac{\lambda}{\lambda^2 + |\xi - \xi_0|^2} \right)^{\frac{n-2}{4}}.$$

In the proof of these symmetry results, we will need the following basic inequality: assume $0 < \theta \leq 1$, $a \geq b \geq 0$, $c \geq 0$, then

$$(a + c)^\theta - (b + c)^\theta \leq a^\theta - b^\theta.$$

For $\sigma \in \mathbb{R}^m$ and $s > 0$, we denote

$$|\sigma|_s = \left( \sum_{i=1}^m |\sigma_i|^s \right)^{1/s}.$$

**Proof of Theorem 6.1.** By Theorem 5.1 we know $f \in C^\infty(\mathbb{R}^{n-1})$ and $f(\xi) \to 0$ as $|\xi| \to \infty$. Let $q = \frac{1}{p-1}$, $g(\xi) = f(\xi)^{p-1}$, $v(x) = (Pf)(x)$, then $0 < q < \infty$, $g \in L^{q+1}(\mathbb{R}^{n-1})$, $v \in L^{\frac{n(q+1)}{n-q}}(\mathbb{R}^n_+)$ and

$$v(x) = \int_{\mathbb{R}^{n-1}} P(x, \xi) g(\xi)^q \, d\xi, \quad g(\xi) = \int_{\mathbb{R}^n_+} P(x, \xi) v(x)^{\frac{n+q}{n-q+1}} \, dx.$$

For $\lambda \in \mathbb{R}$, denote

$$H_\lambda = \{ \xi \in \mathbb{R}^{n-1} : \xi_1 < \lambda \}, \quad Q_\lambda = \{ x \in \mathbb{R}^n_+ : x_1 < \lambda \}.$$

For $\xi \in \mathbb{R}^{n-1}$, $\xi = (\xi_1, \xi'')$, denote $\xi_\lambda = (2\lambda - \xi_1, \xi')$. For $x \in \mathbb{R}^n$, $x = (x_1, x'')$, denote $x_\lambda = (2\lambda - x_1, x'')$. Define $g_\lambda(\xi) = g(\xi_\lambda)$, $v_\lambda(x) = v(x_\lambda)$ and

$$B^\lambda_\lambda = \{ \xi \in H_\lambda : g_\lambda(\xi) > g(\xi) \}, \quad B^\lambda_\lambda = \{ x \in Q_\lambda : v_\lambda(x) > v(x) \}.$$
By a simple change of variable, we see
\[ v(x) = \int_{\mathbb{H}_\lambda} P(x, \xi) g(\xi)^q d\xi + \int_{\mathbb{H}_\lambda} P(x, \xi) g(\xi)^q d\xi, \]
\[ g(\xi) = \int_{Q_{\lambda}} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{Q_{\lambda}} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx. \]

**Case 6.1.** \( 0 < q \leq \frac{n}{n-1} \).

In this case, we choose a number \( r \) such that
\[ 1 \leq r \leq \frac{q+n}{(n-1)q} \quad \text{and} \quad q^{-1} < r. \]
We have
\[ v(x) - v(x) = \int_{\mathbb{H}_\lambda} (P(x, \xi) - P(x, \xi)) (g(\xi)^q - g(\xi)^q) d\xi. \]
Hence for \( x \in B^\nu_\lambda \),
\[ 0 \leq v(x) - v(x) \leq \int_{B^\nu_\lambda} (P(x, \xi) - P(x, \xi)) (g(\xi)^q - g(\xi)^q) d\xi \leq q^r \int_{B^\nu_\lambda} P(x, \xi) g(\xi)^{q-r-1} \left( g(\xi)^{1/r} - g(\xi)^{1/r} \right) d\xi. \]
It follows that
\[ |v(x) - v|_{L^{\frac{n(q+1)}{n-q+1}}(B^\nu_\lambda)} \leq c(n, q, r) \left| g(x)^{q-r-1} \left( g(x)^{1/r} - g(x)^{1/r} \right) \right|_{L^{\frac{q+n}{n-q+1}}(B^\nu_\lambda)} \leq c(n, q, r) |g(x)|^{q-r-1}_{L^{q+1}(B^\nu_\lambda)} \left| g(x)^{1/r} - g(x)^{1/r} \right|_{L^{1+r}(B^\nu_\lambda)}. \]

On the other hand, for \( \xi \in B^\nu_\lambda \), we have
\[ g(\xi) = \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{Q_{\lambda} \setminus B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx \leq \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{Q_{\lambda} \setminus B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx. \]
Since
\[ g(\xi) = \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{Q_{\lambda} \setminus B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx + \int_{Q_{\lambda} \setminus B^\nu_\lambda} P(x, \xi) v(x)^{\frac{q+n}{n-q+1}} dx. \]
we see
\[
g(\xi)_{1/r} - g(\xi)^{1/r} \\
\leq \left( \int_{B_{\lambda}^n} P(x, \xi) v(x, \lambda)^{\frac{n+q+n}{n-1+qr}} \, dx + \int_{B_{\lambda}^n} P(x, \lambda, \xi) v(x)^{\frac{n+q}{n-1+qr}} \, dx \right)^{1/r} \\
- \left( \int_{B_{\lambda}^n} P(x, \xi) v(x)^{\frac{n}{n-1+qr}} \, dx + \int_{B_{\lambda}^n} P(x, \lambda, \xi) v(x)^{\frac{n+q}{n-1+qr}} \, dx \right)^{1/r} \\
= \left( \int_{B_{\lambda}^n} \left| \left( P(x, \xi)^{1/r} v(x, \lambda)^{\frac{n+q+n}{n-1+qr}}, P(x, \lambda, \xi)^{1/r} v(x)^{\frac{n+q}{n-1+qr}} \right) \right|^r \, dx \right)^{1/r} \\
- \left( \int_{B_{\lambda}^n} \left| \left( P(x, \xi)^{1/r} v(x)^{\frac{n}{n-1+qr}}, P(x, \lambda, \xi)^{1/r} v(x)^{\frac{n+q}{n-1+qr}} \right) \right|^r \, dx \right)^{1/r} \\
\leq \left( \int_{B_{\lambda}^n} |(I, II)|_r \, dx \right)^{1/r}.
\]

Here
\[
I = P(x, \xi)^{1/r} \left( v(x, \lambda)^{\frac{n+q+n}{n-1+qr}} - v(x)^{\frac{n+q}{n-1+qr}} \right),
\]
\[
II = P(x, \lambda, \xi)^{1/r} \left( v(x)^{\frac{n}{n-1+qr}} - v(x)^{\frac{n+q}{n-1+qr}} \right).
\]

Hence
\[
g(\xi)_{1/r} - g(\xi)^{1/r} \\
\leq 2 \left( \int_{B_{\lambda}^n} P(x, \xi) \left( v(x, \lambda)^{\frac{n+q+n}{n-1+qr}} - v(x)^{\frac{n+q}{n-1+qr}} \right)^r \, dx \right)^{1/r} \\
\leq \frac{2(q+n)}{(n-1)qr} \left( \int_{B_{\lambda}^n} P(x, \xi) v(x, \lambda)^{\frac{n+q+n}{n-1+qr} - r} \left( v(x, \lambda) - v(x) \right)^r \, dx \right)^{1/r}.
\]

This implies
\[
\left| g^{1/r}_\lambda - g^{1/r} \right|_{L^{(q+1)r}(B_{\lambda}^n)} \\
\leq \frac{2(q+n)}{(n-1)qr} \left( \int_{B_{\lambda}^n} P(x, \xi) v(x, \lambda)^{\frac{n+q+n}{n-1+qr} - r} \left( v(x, \lambda) - v(x) \right)^r \, dx \right)^{1/r} \\
\leq c(n, q, r) \left| v^{\frac{n+q+n}{n-1+qr} - r}_\lambda \right|_{L^{\frac{n+q+n}{n+q+n-1+qr}}(B_{\lambda}^n)} \left| v - v \right|_{L^{\frac{n+q+n}{n+q+n-1+qr}}(B_{\lambda}^n)}^{1/r} \\
\leq c(n, q, r) \left| v^{\frac{n+q+n}{n-1+qr} - 1}_\lambda \right|_{L^{\frac{n+q+n}{n+q+n-1+qr}}(B_{\lambda}^n)} \left| v - v \right|_{L^{\frac{n+q+n}{n+q+n-1+qr}}(B_{\lambda}^n)}^{1/r}.
\]

It follows from the two inequalities above that
\[
\left| g^{1/r}_\lambda - g^{1/r} \right|_{L^{(q+1)r}(B_{\lambda}^n)} \leq c(n, q, r) |v|_{L^{\frac{n+q+n}{n+q+n-1+qr}}(B_{\lambda}^n)}^{q-r-1} \left| g \right|_{L^{(q+1)(2\lambda c_1 - B_{\lambda}^n)}}^{q-r-1} \left| g^{1/r}_\lambda - g^{1/r} \right|_{L^{(q+1)r}(B_{\lambda}^n)}.
\]
Here $e_1 = (1, 0, \cdots, 0)$. After these preparations, we will use the method of moving planes to prove the radial symmetry of $g$ and hence $f$.

First, we have to show it is possible to start. Indeed, for $\lambda$ large enough, $\|g\|_{L^{r+1}(2\lambda e_1'B_1^n)}$ can be arbitrarily small, this implies

$$\left| g^{1/r}_\lambda - g^{1/r}_0 \right|_{L^{(q+1)r}(B^2_n)} \leq \frac{1}{2} \left| g^{1/r}_\lambda - g^{1/r}_0 \right|_{L^{(q+1)r}(B^2_n)}$$

and hence $\left| g^{1/r}_\lambda - g^{1/r}_0 \right|_{L^{(q+1)r}(B^2_n)} = 0$. It follows that $\mathcal{B}^\varrho_n = \emptyset$ when $\lambda$ is large enough.

Next we let $\lambda_0 = \inf \{ \lambda \in \mathbb{R} : \mathcal{B}^\varrho_n = \emptyset \text{ for all } \lambda' \geq \lambda \}$. It follows from the fact $g(\xi) \to 0$ as $|\xi| \to \infty$ and $g(\xi) > 0$ for all $\xi \in \mathbb{R}^{n-1}$ that $\lambda_0$ must be a finite number. By the definition of $\lambda_0$ we know $g_{\lambda_0}(\xi) \leq g(\xi)$ for $\xi \in H_{\lambda_0}$. We claim that $g_{\lambda_0} = g$. Indeed if this is not the case, then since

$$v_{\lambda_0}(x) = v(x) = \int_{H_{\lambda_0}} (P(x,\xi) - P(x_{\lambda_0},\xi)) (g_{\lambda_0}(\xi)v(\xi) - g(\xi)v(\xi)) d\xi$$

and

$$g_{\lambda_0}(\xi) - g(\xi) = \int_{Q_{\lambda_0}} (P(x,\xi) - P(x_{\lambda_0},\xi)) \left( v(\lambda_0)(x) \frac{q+n}{q+n-1} - v(x) \frac{q+n}{q+n-1} \right) dx,$$

we get $g_{\lambda_0}(\xi) < g(\xi)$ for $\xi \in H_{\lambda_0}$. It follows that $\chi_{2\lambda e_1'B_1^n} \to 0$ a.e. as $\lambda \uparrow \lambda_0$. By dominated convergence theorem we have $\|g\|_{L^{r+1}(2\lambda e_1'B_1^n)} \to 0$ as $\lambda \uparrow \lambda_0$. It implies

$$\left| g^{1/r}_\lambda - g^{1/r}_0 \right|_{L^{(q+1)r}(B^2_n)} \leq \frac{1}{2} \left| g^{1/r}_\lambda - g^{1/r}_0 \right|_{L^{(q+1)r}(B^2_n)}$$

when $\lambda$ is very close to $\lambda_0$ and hence $\mathcal{B}^\varrho_n = \emptyset$. This contradicts with the choice of $\lambda_0$. Hence when the moving process stops, we must have symmetry. Moreover we claim that $g_{\lambda}(\xi) < g(\xi)$ for $\xi \in H_{\lambda}$ when $\lambda > \lambda_0$. Indeed for any $\lambda > \lambda_0$ we can not have $g_{\lambda} = g$ because otherwise $g$ is periodic in the first direction and can not lie in $L^{r+1}(\mathbb{R}^{n-1})$. Hence $g_{\lambda} < g$ in $H_{\lambda}$.

By translation, we may assume $g(0) = \max_{\xi \in \mathbb{R}^{n-1}} g(\xi)$, then it follows that the moving plane process from any direction must stop at the origin. Hence $g$ must be radial symmetric and strictly decreasing in the radial direction.

**Case 6.2.** $\frac{n}{n-1} \leq q < \infty$.

In this case, we choose a number $r$ such that

$$1 \leq r < q \text{ and } \frac{(n-1)q}{q+n} \leq r.$$

We have

$$g(\xi) - g(\xi) = \int_{Q_{\lambda}} (P(x,\xi) - P(x_{\lambda},\xi)) \left( v(x_{\lambda}) \frac{q+n}{q+n-1} - v(x) \frac{q+n}{q+n-1} \right) dx.$$
Hence for $\xi \in B^q_\lambda$, 

$$
0 \leq g(\xi) - g(\xi) = 1 \\ \leq \int_{B^q_\lambda} (P(x, \xi) - P(x, \xi)) \left( v(x) \frac{q+n}{n-1} dx - v(x) \frac{q+n}{n-1} dx \right) \ dx \\ \leq \frac{q+n}{n-1} \int_{B^q_\lambda} P(x, \xi) v(x) \frac{q+n}{n-1} dx - v(x) \frac{q+n}{n-1} dx \ dx.
$$

It follows that 

$$
|g - g|_{L^{q+1}(B^q_\lambda)} \\ \leq c(n, q, r) \left( \left| \frac{q+n}{n-1} - r \right| \left( v^{1/r} - v^{1/r} \right) \right) L^{n(q+1)}(B^q_\lambda) \\ = c(n, q, r) \left| \frac{q+n}{n-1} - r \right| \left( v^{1/r} - v^{1/r} \right) L^{n(q+1)}(B^q_\lambda). 
$$

On the other hand, for $x \in B^q_\lambda$, we have 

$$
v(x) = \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi \\ + \int_{H \setminus B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{H \setminus B^q_\lambda} P(x, \xi) g(\xi) d\xi.
$$

Since 

$$
v(x) = \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi \\ + \int_{H \setminus B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{H \setminus B^q_\lambda} P(x, \xi) g(\xi) d\xi,
$$

we see 

$$
0 \leq v(x) \frac{1}{r} - v(x) \frac{1}{r} \\ \leq \left( \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi \right)^{1/r} \\ - \left( \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi + \int_{B^q_\lambda} P(x, \xi) g(\xi) d\xi \right)^{1/r} \\ \leq \left( \int_{B^q_\lambda} \left( P(x, \xi) \frac{q+r}{q} - g(\xi) \frac{q+r}{q} \right) P(x, \xi) \frac{q+r}{q} - g(\xi) \frac{q+r}{q} \right)^{1/r} d\xi \\ \leq 2 \left( \int_{B^q_\lambda} \left( g(\xi) \frac{q+r}{q} - g(\xi) \frac{q+r}{q} \right)^{1/r} d\xi \right)^{1/r} \leq \frac{2q}{r} \left( \int_{B^q_\lambda} P(x, \xi) g(\xi) g(\xi) - g(\xi) d\xi \right)^{1/r}.
$$
Hence
\[
\left| v^{1/r} - v^{1/r} \right|_{L^{n+(q+1)r} (B^*_r)} \leq \frac{2q}{r} \int_{B^*_r} P(x, \xi) g(\xi) g(\xi - g(\xi)') d\xi^{1/r} \left| L^{n+(q+1)} (B^*_r) \right.
\leq c(n, q, r) \left| g^{2-r} (g - g')^{1/r} \right|_{L^{n+1} (B^*_r)}
\leq c(n, q, r) \left| g \right|_{L^{n+1} (B^*_r)} |g - g|_{L^{n+1} (B^*_r)}.
\]
Combining the two inequalities together we see
\[
|g - g|_{L^{n+1} (B^*_r)} \leq c(n, q, r) \left| v \right|_{L^{n+(q+1)r} (\mathbb{R}^n)} \left| g \right|_{L^{n+1} (\mathbb{R}^n)} |g - g|_{L^{n+1} (B^*_r)}.
\]
With this inequality at hand, we may proceed in the same way as in the Case 6.1 to get the conclusion that \( g \) is radial symmetric with respect to some point and strictly decreasing along the radial direction.

Next we look at the special power \( p = \frac{2(n-1)}{n-2} \).

**Proof of Proposition 6.1.** If we know \( f \in L^{2(n-1)/n-2} (\mathbb{R}^{n-1}) \), then it follows from Theorem 6.1 that \( f \in C^\infty (\mathbb{R}^{n-1}) \), it is strictly positive and radial symmetric with respect to some point. By translation we may assume \( f \) is radial symmetric with respect to \( 0 \).

On the other hand, if \( f \) is a solution to the equation, let \( u(x) = (Pf)(x) \), \( \tilde{f}(\xi) = \frac{1}{|\xi|^{n-2}} f \left( \frac{\xi}{|\xi|^2} \right) \), and \( \tilde{u}(x) = \frac{1}{|x|^{n-2}} u \left( \frac{x}{|x|^2} \right) \), by change of variable we know
\[
\tilde{u}(x) = (Pf)(x), \quad \tilde{f}(\xi)^{\frac{n}{n-2}} = \int_{\mathbb{R}^{n-1}} P(x, \xi) \tilde{u}(x)^{\frac{n+2}{n-2}} dx.
\]
and \( \left| \tilde{f} \right|_{L^{2(n-1)/n-2} (\mathbb{R}^{n-1})} = |f|_{L^{2(n-1)/n-2} (\mathbb{R}^{n-1})} \). In particular, \( \tilde{f} \in L^{2(n-1)/n-2} (\mathbb{R}^{n-1}) \) and satisfies the same equation.

Let \( e_1 = (1, 0, \ldots, 0) \in \mathbb{R}^n \), then it follows from Theorem 6.1 that \( f_1(\xi) = \frac{1}{|\xi|^{n-2}} f \left( \frac{\xi}{|\xi|^2} - e_1 \right) \) is smooth and radial symmetric with respect to some point. It follows from Proposition 4.1 and the fact that \( f \in L^{2(n-1)/n-2} (\mathbb{R}^{n-1}) \) that for some \( c_1 > 0 \) and \( c_2 > 0 \), \( f(\xi) = (c_1 |\xi|^2 + c_2)^{-\frac{n-2}{2}} \). Since \( f \) satisfies the equation, it follows that for some \( \lambda > 0 \), \( f(\xi) = c(n) (\frac{\lambda}{|\xi|^2} + |\xi|^2)^{-\frac{n-2}{2}} \).

Next we want to show under the assumption of the Proposition 6.1, \( f \) always lies in \( L^{2(n-1)/n-2} (\mathbb{R}^{n-1}) \). This will be proved by contradiction. Indeed, if this is not the case, then \( \int_{\mathbb{R}^{n-1}} f(\xi)^{\frac{n-2}{n-2}} d\xi = \infty \). Let \( g_0(\xi) = f(\xi)^{\frac{n}{n-2}} \), \( v_0(x) = (Pf)(x) \), then \( g_0 \in L_{loc}^{2(n-1)/n-2} (\mathbb{R}^{n-1}) \), \( \int_{\mathbb{R}^{n-1}} g_0(\xi)^{\frac{n-2}{n-2}} d\xi \leq \infty \) and
\[
v_0(x) = \int_{\mathbb{R}^{n-1}} P(x, \xi) g_0(\xi)^{\frac{n}{n-2}} d\xi, \quad g_0(\xi) = \int_{\mathbb{R}^{n-1}} P(x, \xi) v_0(x)^{\frac{n+2}{n-2}} dx.
\]
It follows from the proof of Theorem 5.1 that \( g_0 \in C^\infty (\mathbb{R}^{n-1}) \) and \( v_0 \in C^\infty (\mathbb{R}_+^n) \).

Let \( g(x) = \frac{1}{|x|^n} g_0 \left( \frac{x}{|x|^2} \right) \), \( v(x) = \frac{1}{|x|^{n-2}} v_0 \left( \frac{x}{|x|^2} \right) \), then
\[
v(x) = \int_{\mathbb{R}^{n-1}} P(x, \xi) g(\xi) \frac{n-2}{n} \, d\xi, \quad g(\xi) = \int_{\mathbb{R}_+^n} P(x, \xi) v(x) \frac{n+2}{n} \, dx.
\]

Moreover for any \( R > 0 \), \( \int_{\mathbb{R}^{n-1}\setminus B_R} g(\xi) \frac{2(n-1)}{n} \, d\xi < \infty \) and \( \int_{\mathbb{R}^{n-1}} g(\xi) \frac{2(n-1)}{n} \, d\xi = \infty \).

For \( \lambda > 0 \), we define \( H_\lambda, g_\lambda \) as in the Case 6.1 of the proof of Theorem 6.1, but let \( B^\lambda_\lambda = \{ \xi \in H_\lambda \setminus \{0\} : g_\lambda(\xi) > g(\xi) \} \). Put the number in the proof of Theorem 6.1 \( r = \frac{n+2}{n-2} \), then the same argument shows
\[
\left| \frac{g_\lambda^{n+2} - g_\lambda^{n-2}}{L^{2(n-1)(n+2)}(B^\lambda_\lambda)} \right| \leq c(n) \left| \frac{g_\lambda^{2(n-2)} - g_\lambda^{2(n+2)}}{L^{2(n-1)(n+2)}(2\lambda e_1 - B^\lambda_\lambda)} \right| \frac{g_\lambda^{n+2} - g_\lambda^{n-2}}{L^{2(n+1)(n+2)}(B^\lambda_\lambda)}.
\]

Note that for \( \xi \in B^\lambda_\lambda \), \( g_\lambda(\xi) > g(\xi) \), hence
\[
\int_{B^\lambda_\lambda} g(\xi) \frac{2(n-1)}{n} \, d\xi \leq \int_{B^\lambda_\lambda} g_\lambda(\xi) \frac{2(n-1)}{n} \, d\xi \leq \int_{\mathbb{R}^{n-1}\setminus H_\lambda} g(\xi) \frac{2(n-1)}{n} \, d\xi < \infty.
\]

When \( \lambda \) is large enough, it implies
\[
\left| \frac{g_\lambda^{n+2} - g_\lambda^{n-2}}{L^{2(n-1)(n+2)}(B^\lambda_\lambda)} \right| \leq \frac{1}{2} \left| \frac{g_\lambda^{n+2} - g_\lambda^{n-2}}{L^{2(n-1)(n+2)}(B^\lambda_\lambda)} \right|
\]
and hence \( \frac{g_\lambda^{n+2} - g_\lambda^{n-2}}{L^{2(n-1)(n+2)}(B^\lambda_\lambda)} = 0 \), \( B^\lambda_\lambda = \emptyset \). Let
\[
\lambda_0 = \inf \{ \lambda > 0 : B^\lambda_\lambda = \emptyset \text{ for all } \lambda' \geq \lambda \}.
\]

We claim \( \lambda_0 = 0 \). Indeed if this is not the case, then \( \lambda_0 > 0 \). We may argue as in the Case 6.1 of the proof of Theorem 6.1 and get \( g_\lambda = g \). In particular, this would imply \( \int_{\mathbb{R}^{n-1}} g(\xi) \frac{2(n-1)}{n} \, d\xi < \infty \), a contradiction. It follows that \( \lambda_0 = 0 \) and \( g(\xi, \xi''') \geq g(-\xi, \xi''') \) for \( \xi_1 < 0 \). Since we may perform this process along any direction, we see \( g \) must be radial symmetric with respect to \( 0 \). Hence \( g_0 \) must be radial symmetric with respect to \( 0 \). For any \( \zeta \in \mathbb{R}^{n-1} \), we may apply the argument to \( g_0(-\zeta) \) and deduce that \( g_0 \) is also radial symmetric with respect to \( \zeta \), hence \( g_0 \) must be a constant function, so is \( f \). But this contradicts with the fact that \( f \) satisfies the equation. \( \square \)
